Fog dispersion
[SAE PAPER 801133] p0397 A81-34164
Wind tunnel investigation of the aerodynamic
hysteresis phenomenon on the F-4 aircraft and
its effects on aircraft motion
[AD-A089851] p0033 N81-11016
An evaluation of statistical methods for the
prediction of maximum time-variant inlet total
pressure distortion
[AD-A089817] p0036 N81-11040
Missile motion sensitivity to dynamic stability
derivatives
[AD-A089750] p0038 N81-11093
Performance evaluation of a prototype
noninterference technique for measurement of
turbine engines compressor blade stress
[AD-A090566] p0094 N81-13061
A direct model pitch measurement with a laser
interferometer using retroreflectors
[AD-A090722] p0094 N81-13068
An evaluation of wind tunnel test techniques for
aircraft nozzle afterbody testing at transonic
Mach numbers
[AD-A091775] p0126 N81-13931
Evaluation of wind tunnel nozzle afterbody test
techniques utilizing a modern twin engine
fighter geometry at Mach numbers from 0.6 to 1.2
[AD-A091545] p0126 N81-13932
Laser-Raman/Rayleigh flow diagnostic techniques
applied to subsonic flow
[AD-A091695] p0133 N81-14275
Laser scattering applications development test
in AEDC tunnel B at Mach number 8
[AD-A093929] p0217 N81-17105
Evaluation of the acoustic and aerodynamic
characteristics of several slot-baffle
configurations for transonic wind tunnel walls
[AD-A093957] p0217 N81-17106
Effects of window configuration on model
pressure distribution in wind tunnels with
perforated walls
[AD-A094213] p0277 N81-19142
Inlet-engine compatability testing techniques in
ground test facilities
p0431 N81-24090
Investigations of free-jet test requirements and
techniques with emphasis on the adaptable jet
stretcher
[AD-A098710] p0439 N81-25044
Sting interference effects on the static dynamic
and base pressure measurements of the standard
dynamics model aircraft at Mach numbers 0.3
through 1.3
[AD-A102612] p0627 N81-32124
Captive aircraft testing at high angles of attack
[AD-A103108] p0628 N81-32140
Supplemental calibration of the AEDC-PWT 16 ft
transonic tunnel aerodynamic test section
[AD-A102384] p0630 N81-32155
Wind tunnel testing of a windshield material or
supersonic aircraft
[AD-A103383] p0635 N81-33163
ASSOCIATION AERONAUTIQUE ET ASTRONAUTIQUE DE
FRANCE, PARIS.
Examination of the vortex regime for highly
swept wings by extrapolation of the Jones method

GABELMAN (IRVING J.) TECHNICAL ASSOCIATES, ROME, N.Y.
Summary of AGARD Lecture Series 100: Methodology for control of life cycle costs for avionics systems
p0047 N81-11924
GARRETT TURBINE ENGINE CO., PHOENIX, ARIZ.
Small turbine engine augmentor. Phase 1: Preliminary design studies of afterburner and duct-burner configurations
[AD-A101595] p0583 N81-30131
Solar Brayton engine/alternator set
p0588 N81-30529
GENERAL ACCOUNTING OFFICE, WASHINGTON, D. C.
Are management problems in the acquisition of aircraft gas turbine engines being corrected
[AD-A090520] p0008 N81-12928
The F/A-18 Naval Strike Fighter: Progress has been made but problems and concerns continue
[AD-A095287] p0333 N81-20069
A look at NASA's Aircraft Energy Efficiency program
[PSAD-80-50] p0334 N81-20077
Review of Air Force's next generation trainer aircraft program Department of Defense
[AD-A096238] p0341 N81-21071
Air Force and Navy plans to acquire trainer aircraft
[AD-A096237] p0342 N81-21072
DOD's use of remotely piloted vehicle technology offers opportunities for saving lives and dollars
[AD-A097419] p0388 N81-23074
F-16 integrated logistics support: Still time to consider economical alternatives
[PB81-137473] p0389 N81-23079
Operational and support costs of the Navy's F/A-18 can be substantially reduced
[PB81-160814] p0467 N81-26125
GENERAL DYNAMICS/CONVAIR, SAN DIEGO, CALIF.
Development of advanced interceptor substructural material
[AD-A090127] p0038 N81-11116
Development of advanced interceptor substructural material
[AD-A103836] p0640 N81-33241
GENERAL DYNAMICS CORP., FORT WORTH, TEX.
Analysis of wind tunnel test results for a 9.39-per cent scale model of a VSTOL fighter/attack aircraft. Volume 1: Study overview
[NASA-CR-152391-VOL-1] p0384 N81-23030
Analysis of wind tunnel test results for a 9.39-per cent scale model of a VSTOL fighter/attack aircraft. Volume 2: Evaluation of prediction methodologies
[NASA-CR-152391-VOL-2] p0384 N81-23031
Analysis of wind tunnel test results for a 9.39-per cent scale model of a VSTOL fighter/attack aircraft. Volume 3: Effects of configuration variations from baseline
[NASA-CR-152391-VOL-3] p0384 N81-23032
Analysis of wind tunnel test results for a 9.39-per cent scale model of a VSTOL fighter/attack aircraft. Volume 4: RALS R104 aerodynamic characteristics and comparisons with R205 configuration aerodynamic characteristics
[NASA-CR-152391-VOL-4] p0384 N81-23033
Fountain-jet turbulence
[AD-A098098] p0423 N81-24028
Study of an engine flow diverter system for a large scale ejector powered aircraft model
[NASA-CR-166163] p0540 N81-28096
Evaluation of pressure and thermal data from a wind tunnel test of a large-scale, powered, STOL fighter model
[NASA-CR-166170] p0635 N81-33162
GENERAL DYNAMICS/FORT WORTH, TEX.
Transonic flutter and gust-response tests and analyses of a wind-tunnel model of a torsion-free-wing fighter airplane
[AIAA 81-0650] p0307 A81-29503
Design to cost and the F-16 multirole fighter
p0046 N81-11911
Experimental and analytical study on the flutter and gust response characteristics of a torsion-free-wing airplane model
[NASA-CR-159283] p0340 N81-21059
GENERAL ELECTRIC CO., BURLINGTON, VT.
High impulse gun airborne demonstration. GAU-13/A weapon, feed system, gun drive and electronic controls
[AD-A101698] p0582 N81-30120
GENERAL ELECTRIC CO., CINCINNATI, OHIO.
Mixer nozzle aeroacoustic characteristics for the energy efficient engine
[AIAA PAPER 81-1994] p0621 A81-40639
Core compressor exit stage study. Volume 3: Data and performance report for screening test configurations
[NASA-CR-159499] p0070 N81-12086
Curved centerline air intake for a gas turbine engine
[NASA-CASE-LEW-13201-1] p0143 N81-14999
Aerodynamic stability analysis of NASA J85-13/planar pressure pulse generator installation
[NASA-CR-165141] p0143 N81-15004
TF34 engine compression system computer study
[NASA-CR-159889] p0143 N81-15005
Core compressor exit stage study. Volume 2: Data and performance report for the baseline configuration
[NASA-CR-159498] p0195 N81-16051
Acoustic and aerodynamic performance investigation of inverted velocity profile coannular plug nozzles
[NASA-CR-3149] p0203 N81-16854
Turbine modeling technique to generate off-design performance data for both single and multistage axial-flow turbines
[NASA-CR-165244] p0213 N81-17070
Samarium cobalt (SMCO) generator/engine integration study
[AD-A092904] p0214 N81-17087
Crack growth modeling in an advanced powder metallurgy alloy
[AD-A093992] p0210 N81-17235
Aerodynamic/acoustic performance of YJ101/double bypass VCE with coannular plug nozzle
[NASA-CR-159869] p0220 N81-17846
VCE early acoustic test results of General Electric's high-radius ratio coannular plug nozzle
p0245 N81-17999
Forward velocity effects on fan noise and the suppression characteristics of advanced inlets as measured in the NASA Ames 40 by 80 foot wind tunnel: Acoustic data report
[NASA-CR-152329] p0258 N81-18798
Apparatus for sensor failure detection and correction in a gas turbine engine control system
[NASA-CASE-LEW-12907-2] p0273 N81-19115
Integrated control system for a gas turbine engine
[NASA-CASE-LEW-12594-2] p0274 N81-19116
Evaluation of fuel character effects J79 smokeless combustor
[AD-A095057] p0278 N81-19323
Energy efficient engine flight propulsion system: Aircraft/engine integration evaluation
[NASA-CR-159584] p0375 N81-22051
Engine life development
p0430 N81-24081
Design of a V/STOL propulsion system for a large-scale fighter model
[NASA-CR-166162] p0442 N81-25074
Blade loss transient dynamics analysis, volume 1. Task 1: Survey and perspective
[NASA-CR-165373-VOL-1] p0496 N81-27089
Blade loss transient dynamics analysis, volume 2. Task 2: Theoretical and analytical development. Task 3: Experimental verification
[NASA-CR-165373-VOL-2] p0496 N81-27090
Blade loss transient dynamics analysis. Volume 3: User's manual for TETRA program
[NASA-CR-165373-VOL-3] p0496 N81-27091
Quiet Clean Short-haul Experimental Engine (QCSEE); acoustic performance of a 50.8-cm (20 inch) diameter variable pitch fan and inlet,

test results and analysis, volume 1
[NASA-CR-135117] p0497 N81-27097
High temperature strain gage system for
application to turbine engine components
[AD-A101713] p0583 N81-30132
Structures performance, benefit, cost-study
[NASA-CR-165456] p0597 N81-31194
CF6-50 engine emissions testing with traverse
probe
[AD-A102159] p0600 N81-31218
GENERAL ELECTRIC CO., EVENDALE, OHIO.
Design and development of the combustor inlet
diffuser for the NASA/GE energy efficient engine
[ASME PAPER 81-GT-129] p0316 A81-30033
Supersonic stall flutter of high-speed fans
[ASME PAPER 81-GT-184] p0317 A81-30078
Engine diagnostics program: CF6-50 engine
performance deterioration
[NASA-CR-159867] p0078 N81-12085
Design concepts for low-cost composite turbofan
engine frame
[NASA-CR-165217] p0376 N81-22053
Heat pipe solar receiver with thermal energy
storage
p0588 N81-30532
GENERAL ELECTRIC CO., LYNN, MASS.
Comparison of experimental and computational
shock structure in a transonic compressor rotor
[ASME PAPER 80-GT-81] p0109 A81-17953
NASA VCE test bed engine aerodynamic performance
characteristics and test results
[AIAA PAPER 81-1594] p0508 A81-40969
Maritime patrol aircraft engine study. General
Electric derivative engines. Volume 2:
Appendix A. Performance data - GE27/T3 study
A1 turboprop
[AD-A089336] p0028 N81-10068
Maritime patrol aircraft engine study. General
Electric derivative engines. Volume 3:
Appendix B. Performance data - TF34/T7 study
A1 turboprop
[AD-A089279] p0028 N81-10069
High bypass turbofan component development,
modification 2
[AD-A093156] p0215 N81-17093
VCE test bed engine for supersonic cruise research
p0245 N81-17995
Quiet Clean General Aviation Turbofan (QCGAT)
technology study, volume 1
[NASA-CR-164222] p0376 N81-22052
Experimental verification of turboblading
aeromechanics
p0432 N81-24092
Propulsion system study for Small Transport
Aircraft Technology (STAT)
[NASA-CR-165330] p0442 N81-25078
GENERAL ELECTRIC CO., PHILADELPHIA, PA.
Improved ceramic heat exchanger materials
[NASA-CR-159678] p0132 N81-14082
GENERAL ELECTRIC CO., SCHENECTADY, N. Y.
Development of high-temperature turbine
subsystem technology to a technology readiness
status, phase 2
[FE-1806-72] p0134 N81-14332
CF 6 engine diagnostics
p0597 N81-31197
CF6 high pressure compressor and turbine
clearance evaluations
p0598 N81-31198
Engine condition monitoring: CF6 family 60's
through the 80's
p0600 N81-31215
GENERAL MOTORS CORP., INDIANAPOLIS, IND.
The effects of solidity, interblade phase angle
and reduced frequency on the time-variant
aerodynamic response of a compressor stator
[AD-A090546] p0081 N81-12108
GENERAL TECHNOLOGY APPLICATIONS, INC., ARLINGTON, VA.
Application of General Technology Applications,
Incorporated (GTA) blending process to
antimisting fuel additives
[AD-A100692] p0551 N81-29247
GEORGE WASHINGTON UNIV., WASHINGTON, D.C.
Program of research in laminar flow control in
the JIAFS at NASA Langley Research Center
[NASA-CR-164843] p0627 N81-32121
GEORGIA INST. OF TECH., ATLANTA.
An iterative finite element-integral technique
for predicting sound radiation from turbofan
inlets
[AIAA PAPER 81-1981] p0624 A81-49736
Prediction of sound radiated from different
practical jet engine inlets
[NASA-CR-163824] p0137 N81-14789
Behavior of continuous filament advanced
composite isogrid structure
p0377 N81-22095
Prediction of sound radiation from different
practical jet engine inlets
[NASA-CR-164620] p0500 N81-27886
Two-dimensional dynamic stall as simulated in a
varying freestream
[NASA-CR-164829] p0629 N81-32154
Development of an analytical technique for the
optimization of jet engine and duct acoustic
liners
[NASA-CR-164872] p0639 N81-33205
GJERDING (D. K.) SIMULATION ELECTRONICS, SEATTLE,
WASH.
User's manual for flight Simulator Display
System (FSDS)
[NASA-CR-164295] p0391 N81-23095
GOODRICH (B. F.) CO., AKRON, OHIO.
Aluminized coding study for retrofitting
in-service slide materials
[AD-A094170] p0255 N81-18201
GOODYEAR AEROSPACE CORP., AKRON, OHIO.
Microprocessor software applications for flight
training simulators
p0044 N81-11658
Microcomputer array processor system
p0044 N81-11673
GOODYEAR AEROSPACE CORP., LITCHFIELD PARK, ARIZ.
Superhard transparent coating optimization program
[AD-A091083] p0092 N81-13048
GRUMMAN AEROSPACE CORP., BETHPAGE, N.Y.
Transonic swept wings studied by the
lifting-line theory
p0509 A81-41090
Complex configuration analysis at transonic speeds
p0190 N81-16016
Demonstration of a method for determining
critical store configurations for wing store
flutter
[AD-A092257] p0197 N81-16068
Display concepts for control configured vehicles
p0213 N81-17076
VTOL in ground effect flows for closely spaced
jets
[NASA-CR-152321] p0271 N81-19095
Aircraft wing weight build-up methodology with
modification for materials and construction
techniques
[NASA-CR-166173] p0387 N81-23068
Axisymmetric & non-axisymmetric exhaust jet
induced-effects on a V/STOL vehicle design.
Part 1: Data presentation
[NASA-CR-166146] p0441 N81-25068
Turbulent interactions on airfoils at transonic
speeds: Recent developments
p0483 N81-26047
Analysis and design of supersonic aircraft based
on inviscid nonlinear Eulerian equations.
Part 1: Rotational Euler solutions with
explicit shock fitting
[AD-A103434] p0637 N81-33192

H

HAMILTON STANDARD, WINDSOR LOCKS, CONN.
Reliability advancement for electronic engine
controllers. Volume 2: Guide to development
of high reliability electronic engine
controllers
[AD-A098614] p0444 N81-25086
Reliability advancement for electronic engine
controllers, volume 1
[AD-A098623] p0444 N81-25087
HARRIS CORP., MELBOURNE, FLA.
Tent shaped phased array
[AD-A103927] p0640 N81-33393
HERCULES, INC., CUMBERLAND, MD.
Interactive multi-mode blade impact analysis
[ASME PAPER 81-GT-79] p0314 A81-29987
HICKOK (EUGENE A.) AND ASSOCIATES, WAYZATA, MINN.
National runway friction measurement program
[AD-A097334] p0391 N81-23097

HITCO, GARDENA, CALIF.
Fabrication and physical testing of graphite composite panels utilizing woven graphite fabric with current and advanced state-of-the-art resin systems
[NASA-CR-152292] p0218 N81-17175
Development of assembly techniques for fire resistant aircraft interior panels
[NASA-CR-152119] p0254 N81-18097

HONEYWELL, INC., MINNEAPOLIS, MINN.
Demonstration Advanced Avionics System (DAAS) functional description
[NASA-CR-152405] p0389 N81-23080

HONEYWELL SYSTEMS AND RESEARCH CENTER, MINNEAPOLIS, MINN.
Failure management techniques for high survivability
p0042 N81-11272
Two-axis, fluidically controlled thrust vector control system for an ejection seat
[AD-A093888] p0204 N81-16996
Real-time feasibility for generation of nonlinear textured terrain
[AD-A095070] p0277 N81-19141
F-8C adaptive control law refinement and software development
[NASA-CR-163093] p0377 N81-22059

HUGHES HELICOPTERS, CULVER CITY, CALIF.
Ultrasonic cold forming of aircraft sheet materials
[AD-A096351] p0344 N81-21239
Wind tunnel tests of large- and small-scale rotor hubs and pylons
[AD-A098510] p0439 N81-25043
Preliminary design of a tip-jet-driven heavy lift helicopter incorporating circulation control
[AD-A099192] p0486 N81-26120
The methodology of fatigue analysis and testing: Main rotor blades and hub, Hughes YAH-64 advanced attack helicopter
p0488 N81-26139

HUGHES RESEARCH LABS., MALIBU, CALIF.
Definition, analysis and development of an optical data distribution network for integrated avionics and control systems
[NASA-CR-159370] p0590 N81-30962

HUMAN ENGINEERING LABS., ABERDEEN PROVING GROUND, MD.
Helicopter In-flight Validation System (HELIVALS)
[AD-A091129] p0092 N81-13050
A preliminary human factors flight assessment of a Marconi automatic map
[AD-A092585] p0193 N81-16036
An investigation of the five point restraint system for aviators
[AD-A093065] p0205 N81-16998
The background and bases for the proposed military standard on acoustical noise limits in helicopters
[AD-A099814] p0500 N81-27890
The background and bases for the proposed military standard on acoustical noise limits in helicopters
p0604 N81-31459

HUMAN RESOURCES RESEARCH ORGANIZATION, ALEXANDRIA, VA.
Civil helicopter wire strike assessment study. Volume 2: Accident analysis briefs
[NASA-CR-152390] p0023 N81-10019

Icing tunnel tests of a glycol-exuding porous leading edge ice protection system on a general aviation airfoil
[AIAA PAPER 81-0405] p0168 A81-20837
Summary of typical parameters that affect sound transmission through general aviation aircraft structures
[SAE PAPER 810562] p0518 A81-42728
The state of the art of general aviation autopilots - Now and in the future
[SAE PAPER 810582] p0520 A81-42744
Development of a simple, self-contained flight test data acquisition system
[SAE PAPER 810596] p0520 A81-42754
Effects of wingtip modifications on handling qualities of agricultural aircraft
[SAE PAPER 810606] p0522 A81-42763
A feasibility study for advanced technology integration for general aviation
[NASA-CR-159381] p0185 N81-15974
Comparison of selected lift and sideslip characteristics of the Ayres Thrush S2R-800, winglets off and winglets on, to full-scale wind-tunnel data
[NASA-CR-165710] p0423 N81-24026
Study of noise reduction characteristics of multilayered panels and dual pane windows with Helmholtz resonators
[NASA-CR-164370] p0438 N81-24857
Icing tunnel tests of a glycol-exuding porous leading edge ice protection system on a general aviation airfoil
[NASA-CR-164377] p0439 N81-25041

KANSAS UNIV. CENTER FOR RESEARCH, INC., LAWRENCE.
The state of the art of general aviation autopilots
[NASA-CR-159371] p0197 N81-16066
The DAST-1 remotely piloted research vehicle development and initial flight testing
[NASA-CR-163105] p0207 N81-17038
A theoretical investigation of ground effects on USB configurations
[NASA-CR-159005] p0262 N81-19021
A program to evaluate a control system based on feedback of aerodynamic pressure differentials, part 1
[NASA-CR-164684] p0583 N81-30134
A program to evaluate a control system based on feedback of aerodynamic pressure differentials. Part 2: Data report for phase 1 wind tunnel test
[NASA-CR-164685] p0584 N81-30135

KENTRON INTERNATIONAL, INC., HAMPTON, VA.
Graphite polyimide fabrication research for supersonic cruise aircraft
p0182 A81-22665
IPAD applications to the design, analysis, and/or machining of aerospace structures
[AIAA 81-0512] p0301 A81-29388
Sensitivity of optimum solutions to problem parameters
[AIAA 81-0548] p0301 A81-29399

Comparison of analysis and flight test data for a drone aircraft with active flutter suppression
[AIAA 81-0640] p0306 A81-29495
Determination of crash test pulses and their application to aircraft seat analysis
[SAE PAPER 810611] p0522 A81-42767
Multiobjective insensitive design of airplane control systems with uncertain parameters
[AIAA 81-1818] p0555 A81-44108
Pareto-optimal multi-objective design of airplane control systems
p0563 A81-45518
Preliminary design characteristics of a subsonic business jet concept employing an aspect ratio 25 strut braced wing
[NASA-CR-159361] p0032 N81-11013
Induced drag ideal efficiency factor of arbitrary lateral-vertical wing forms
[NASA-CR-3357] p0072 N81-12022
A study of high-altitude manned research aircraft employing strut-braced wings of high-aspect-ratio
[NASA-CR-159262] p0333 N81-20067
ISSYS: An integrated synergistic Synthesis System
[NASA-CR-159221] p0543 N81-28783
Design and analysis of a fuel-efficient single-engine, turboprop-powered, business airplane
[NASA-CR-165768] p0596 N81-31184

Aircraft EMP isolation study
[AD-A093772] p0219 N81-17333

MISSISSIPPI STATE UNIV., MISSISSIPPI STATE.
A PANSONIC Navier-Stokes solver
[AIAA PAPER 81-1195] p0454 A81-38077
Full scale visualization of the wing tip vortices generated by a typical agricultural aircraft
[NASA-CR-159382] p0071 N81-12019
Propeller propulsion integration, phase 1
[NASA-CR-163921] p0196 N81-16058
An application of wake survey rakes to the experimental determination of thrust for a propeller driven aircraft
[NASA-CR-163967] p0251 N81-18046
Investigation of Flight Test Methods for measuring the performance of general aviation aircraft
[NASA-CR-164057] p0333 N81-20065
An experimental investigation of the aerodynamics and cooling of a horizontally-opposed air-cooled aircraft engine installation
[NASA-CR-3405] p0372 N81-22015

MISSISSIPPI STATE UNIV., STATE COLLEGE.
An approximate factorization solution of the Navier-Stokes equations for transonic flow using body-fitted coordinates with application to NACA 64A010 airfoils
p0249 N81-18024

MISSISSIPPI UNIV., UNIVERSITY.
An application of wake survey rakes to the experimental determination of thrust for a propeller driven aircraft
[NASA-CR-163920] p0186 N81-15986

MISSOURI UNIV. -COLUMBIA.
An analysis of opportunistic maintenance policy for the F100PW100 aircraft engine
[AD-A097548] p0384 N81-23025

MITRE CORP., MCLEAN, VA.
Analysis of potentially correctable landing delays at Atlanta
[AD-A089408] p0024 N81-10032
Conflict monitoring analysis of parallel route spacing in the high altitude airspace, volume 2
[AD-A094152] p0250 N81-18038
Automatic Traffic Advisory and Resolution Service (ATARS) multi-site, algorithms, revision 1
[AD-A094195] p0250 N81-18039
Conflict monitoring analysis of parallel route spacing in the high altitude conus airspace, volume 1
[AD-A094071] p0250 N81-18041
An update of the Discrete Address Beacon System (DABS) alternatives study
[AD-A096264] p0340 N81-21052
Results of an active beacon collision avoidance experiment conducted in the Los Angeles airspace
[AD-A096285] p0340 N81-21053
Discrete Address Beacon System (DABS) data link capacity utilization
[AD-A098173] p0425 N81-24044
Consolidated Cab Display (CCD) System, Project Planning Document (PPD)
[AD-A098651] p0440 N81-25056
Discrete address beacon system data link capacity requirements
[AD-A101731] p0581 N81-30107
Upgraded FAA Airfield Capacity Model. Volume 1: Supplemental user's guide
[AD-A104154] p0639 N81-33216
Upgraded FAA Airfield Capacity Model. Volume 2: Technical description of revisions
[AD-A104155] p0639 N81-33217

MONSANTO RESEARCH CORP., DAYTON, OHIO.
Trace chemical analysis methodology
[AD-A090762] p0083 N81-12191

MOTOREN- UND TURBINEN-UNION MUENCHEN G.M.B.H. (WEST GERMANY).
Full annular combustor test facility for high pressure/high temperature testing
p0432 N81-24097

N

Component research for future propulsion systems
  p0454 A81-38050
Fireworthiness of transport aircraft interior
  systems
  [AIAA PAPER 81-1142] p0459 A81-39131
Development of a comprehensive analysis for
  rotorcraft. I - Rotor model and wake analysis
  p0465 A81-35896
A pilot's assessment of helicopter
  handling-quality factors common to both
  agility and instrument flying tasks
  p0471 A81-40120
Identification of a linear model of
  rotor-fuselage dynamics from nonlinear
  simulation data
  p0472 A81-40125
Computerized three-dimensional aerodynamic
  design of a lifting rotor blade
  [AHS 80-2] p0473 A81-40137
Navigation errors encountered using
  weather-mapping radar for helicopter IFR
  guidance to oil rigs
  [AHS 80-16] p0474 A81-40147
A piloted simulator investigation of static
  stability and stability/control augmentation
  effects on helicopter handling qualities for
  instrument approach
  [AHS 80-30] p0476 A81-40160
NASA/FAA flight-test investigation of helicopter
  microwave landing system approaches
  [AHS 80-55] p0478 A81-40180
Transonic swept wings studied by the
  lifting-line theory
  p0509 A81-41090
Helicopter theory
  p0513 A81-41823
Transonic wing design using potential-flow codes
  - Successes and failures
  [SAE PAPER 810565] p0518 A81-42730
Full-scale study of the cooling system
  aerodynamics of an operating piston engine
  installed in a light aircraft wing panel
  [SAE PAPER 810623] p0523 A81-42777
Lift-enhancing surfaces on several advanced
  V/STOL fighter/attack aircraft concepts
  [AIAA PAPER 81-1675] p0534 A81-43946
Analysis of aircraft longitudinal handling
  qualities
  [AIAA 81-1771] p0554 A81-44092
Investigation of control, display, and
  crew-loading requirements for helicopter
  instrument approach
  [AIAA 81-1820] p0555 A81-44110
Kinematic properties of rotary-wing and
  fixed-wing aircraft in steady coordinated
  high-g turns
  [AIAA PAPER 81-1855] p0560 A81-44554
Automatic helical rotorcraft descent and landing
  using a Microwave Landing System
  [AIAA PAPER 81-1857] p0560 A81-44556
A vortex-lattice method for calculating
  longitudinal dynamic stability derivatives of
  oscillating delta wings
  [AIAA PAPER 81-1876] p0561 A81-44570
Clear air turbulence - An airborne alert system
  p0562 A81-44648
Numerical and classical analysis of V/STOL
  aircraft using selected propulsion systems
  [AIAA PAPER 81-1676] p0563 A81-44898
Full-scale wind-tunnel test of the aeroelastic
  stability of a bearingless main rotor
  p0573 A81-46620
A flight investigation of static stability,
  control augmentation, and flight director
  influences on helicopter IFR handling qualities
  p0574 A81-46623
Influence of sideslip on the kinematics of the
  helicopter in steady coordinated turns
  p0576 A81-46646
A piloted simulation of the backup control
  system engagement for the YAH-64
  p0576 A81-46686
Time delays in flight simulator visual displays
  p0615 A81-48369

[AD-A099298] p0484 N81-26086

NAVAL OCEANOGRAPHIC OFFICE, BAY ST. LOUIS, MISS.

Hydrographic applications of the global positioning system
[AD-A093750] p0206 N81-17029

NAVAL POSTGRADUATE SCHOOL, MONTEREY, CALIF.

Numerical optimization of circulation control airfoils
[AIAA PAPER 81-0016] p0157 A81-20540

The use of parametric cost estimating relationships as they pertain to aircraft airframes: A new perspective
[AD-A089525] p0027 N81-10060

Transonic cascade wind tunnel modification and initial tests
[AD-A091080] p0090 N81-13031

Radio direction finding on high frequency short duration signals
[AD-A092136] p0192 N81-16029

Validation of a two dimensional primitive variable computer code for flow fields in jet engine test cells
[AD-A092138] p0196 N81-16060

Methodology for determining sampling intervals
[AD-A092591] p0202 N81-16825

A study of State Feedback Implicit Model following control for VSTOL aircraft
[AD-A093253] p0216 N81-17099

Evaluation of a subsonic cascade wind tunnel for compressor blade testing
[AD-A093591] p0218 N81-17107

An investigation of the reacting and non-reacting flow characteristics of solid ramjets
[AD-A094567] p0253 N81-18059

Validation of a two-dimensional primitive variable computer code for flow fields in jet engine test cells
[AD-A094615] p0254 N81-18067

Challenge for operational experience feedback in aircraft design: An aircraft design example
[AD-A096088] p0341 N81-21067

Low-range airspeed sensors
[AD-A096359] p0342 N81-21076

ATTACK vs SCAN: A comparison of endgame aircraft survivability computer programs
[AD-A097663] p0388 N81-23076

Investigation of the use of liquid crystal thermography to study flow over turbomachinery blades
[AD-A097289] p0391 N81-23089

An investigation of the combustion behavior of solid fuel ramjets
[AD-A098481] p0445 N81-25240

Flow control about an airborne laser turret
[AD-A100110] p0537 N81-28060

Computer evaluation of the on-and-off design of an axial air turbine
[AD-A101102] p0549 N81-29131

NAVAL RESEARCH LAB., WASHINGTON, D. C.

Abstract interface specifications for the A-7E device interface module
[AD-A092696] p0202 N81-16770

Evaluation of the A-7 requirements document by analysis of change data
[AD-A094888] p0272 N81-19103

Application of ion implantation for the improvement of localized corrosion resistance of M50 steel bearings
[AD-A097230] p0393 N81-23466

Results of a feasibility study for determining the yaw angle of a landing aircraft
[AD-A099765] p0495 N81-27084

NAVAL SHIP RESEARCH AND DEVELOPMENT CENTER, ANNAPOLIS, MD.

Structural response methods and evaluation results for helicopter landing decks on 210- and 270-foot USCCG cutters
[AD-A102420] p0601 N81-31233

NAVAL SHIP RESEARCH AND DEVELOPMENT CENTER, BETHESDA, MD.

Numerical optimization of circulation control airfoils
[AIAA PAPER 81-0016] p0157 A81-20540

P-3 Orion fuel-saving modification wind tunnel study
[AD-A091906] p0194 N81-16084
Some dynamic properties of rigid two-bladed fully gimballed tip-jet helicopter rotor with circulation control
[AD-A094031] p0252 N81-18054
Lift-propulsion system weight variation for very heavy lift helicopters
[AD-A099169] p0490 N81-26151
Experimental development of an advanced circulation control wing system for Navy STOL aircraft
[AD-A101309] p0581 N81-30116
Investigation of the circulation control wing/upper surface blowing high-lift system on a low aspect ratio semispan model
[AD-A103090] p0627 N81-32128
Design of a slot height distribution for increased hover control power on a circulation control rotor
[AD-A103535] p0637 N81-33194

NAVAL SURFACE WEAPONS CENTER, DAHLGREN, VA.
Fiber release from impacted graphite reinforced epoxy composites
[NASA-CR-163684] p0038 N81-11117
Optimal bodies for minimum total drag at supersonic speeds
[AD-A091235] p0091 N81-13036

NAVAL SURFACE WEAPONS CENTER, WHITE OAK, MD.
A comparison of Newton-like methods for the transonic small disturbance equation
[AD-A090270] p0033 N81-11017

NAVAL TRAINING EQUIPMENT CENTER, ORLANDO, FLA.
Glideslope descent-rate cuing to aid carrier landings
[AD-A092193] p0192 N81-16033
The effects of various fidelity factors on simulated helicopter hover
[AD-A102028] p0601 N81-31232

NAVAL WEAPONS CENTER, CHINA LAKE, CALIF.
An investigation of safety hazards and reliability problems in aerial refueling stores
[AD-A091788] p0127 N81-13938
Vanadium trineodecanoate promoter for fiberglass-polyester soil surfacings
[AD-A091785] p0132 N81-14084

NEILSEN ENGINEERING AND RESEARCH, INC., MOUNTAIN VIEW, CALIF.
Continued development and correlation of analytically based weight estimation codes for wings and fuselages
[NASA-CR-152331] p0251 N81-18044
Data base for the prediction of airframe/propulsion system interference effects
[NASA-CR-152316] p0251 N81-18045

NETWORK ANALYSIS CORP., VIENNA, VA.
Communications support for National Flight Data Center information system

Design, fabrication and test of a complex
helicopter airframe section
[SAE PAPER 801213] p0408 A81-34221
CH-53E emergency flotation system design study
[AD-A101640] p0548 N81-29124
UNITED TECHNOLOGIES CORP., WEST PALM BEACH, FLA.
Flight test of a full authority Digital
Electronic Engine Control system in an F-15
aircraft
[AIAA PAPER 81-1501] p0507 A81-40912
UNITED TECHNOLOGIES CORP., WINDSOR LOCKS, CONN.
Requirements, technology and configuration
evaluation for Crash Survivable Flight Data
Recording (CSFDR) system
[AD-A098584] p0442 N81-25072
UNITED TECHNOLOGIES RESEARCH CENTER, EAST HARTFORD,
CONN.
A model for the analysis of
premixing-prevaporizing fuel-air mixing passages
[AIAA PAPER 81-0345] p0165 A81-20767
An active control system for helicopter
vibration reduction by higher harmonic pitch
[AHS 80-71] p0479 A81-40109
Autoignition characteristics of aircraft-type
fuels
p0562 A81-44666
Analysis of laminar and turbulent symmetric
blunt trailing-edge flows
[AD-A098703] p0439 N81-25046
Turbojet engine blade damping
[NASA-CR-165406] p0549 N81-29130
UNIVERSITE DES SCIENCES ET TECHNIQUES DE LILLE
(FRANCE).
Influence of light aircraft architecture on its
spin characteristics
[AAAF-NT-80-11] p0081 N81-12111
Some new research approaches to aircraft spin
studies
[AAAF-NT-80-12] p0082 N81-12112
UNIVERSITY OF SOUTH FLORIDA, TAMPA.
Investigation of low level aircraft nonavionic
nonlinear interference
[AD-A098794] p0491 N81-26349
UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES.
Transonic swept wings studied by the
lifting-line theory
p0509 A81-41090
UTAH UNIV., SALT LAKE CITY.
Noise suppression methods for robust speech
processing
[AD-A100629] p0551 N81-29323

V

VEREINIGTE FLUGTECHNISCHE WERKE-FOKKER G.M.B.H.,
BREMEN (WEST GERMANY).
Civil component program Wing Section. New
calculation methods for subsonic and transonic
interference with planar and spatial flows
[BMFT-FB-W-80-022] p0424 N81-24034
Civil component program Wing Section. Transonic
wing development
[BMFT-FB-W-80-021] p0426 N81-24052
Civil component program Wing Section. The
design of the transonic airfoil Va 2
[BMFT-FB-W-80-023] p0426 N81-24053
From the civil component program 'IFAS':
Fundamentals of engine simulation, using
turbopowered simulator (TPS) technology in
wind tunnel tests
[BMFT-FB-W-80-030] p0541 N81-28111
VEREINIGTE FLUGTECHNISCHE WERKE G.M.B.H., BREMEN

Estimation of relative total cost for aircraft
systems
p0047 N81-11922
Transonic wing technology for transport aircraft
p0188 N81-16002
Philosophy and results of steady and unsteady
test techniques on a large scale transport
aircraft model in the ONERA transonic tunnel
S1 MA. Part 1: Philosophy and results of
steady tests. Part 2: Interest of large
models in unsteady aerodynamics
p0190 N81-16019
Onboard and ground test of an autonomous
navigation system based on terrain correlation
p0544 N81-29069
VIGYAN RESEARCH ASSOCIATES, INC., HAMPTON, VA.
Leading-edge 'Vortex Flaps' for enhanced
subsonic aerodynamics of slender wings
p0012 A81-11640

Hinged strakes for enhanced maneuverability at
high angles of attack
[AIAA PAPER 81-0357] p0165 A81-20776
Computation of wind tunnel model deflections
[AIAA 81-0482] p0300 A81-29381
Subsonic pitch-up alleviation on a 74 deg delta
wing
[NASA-CR-165749] p0584 N81-30137
**VIRGINIA POLYTECHNIC INST. AND STATE UNIV.,
BLACKSBURG.**
Curved-flow, rolling-flow, and oscillatory
pure-yawing wind-tunnel test methods for
determination of dynamic stability derivatives
p0241 A81-26933
Flow separation in inlets at incidence angles
p0297 A81-29114
Effectiveness of leading-edge vortex flaps on 60
and 75 degree delta wings
p0352 A81-31368
Engine identification for adaptive control
p0080 N81-12100
An investigation of the dynamic stalling
characteristics of rotating axial-flow
compressor blades
p0093 N81-13054
The 1H and 13C fourier transform NMR
characterization of jet fuels derived from
alternate energy sources
[AD-A098305] p0437 N81-24284
Continued research on selected parameters to
minimize community annoyance from airplane noise
[NASA-CR-164299] p0438 N81-24602
A study of the effects of store aerodynamic on
wing/store flutter
p0490 N81-26153
Dynamic simulation of airborne high power systems
[AD-A101316] p0552 N81-29362
VIRGINIA UNIV., CHARLOTTESVILLE.
Nonlinear analysis of squeeze film dampers
applied to gas turbine helicopter engines
[AD-A091905] p0196 N81-16062
Minimum noise impact aircraft trajectories
[NASA-CR-164719] p0594 N81-31159
**VON KARMAN INST. FOR FLUID DYNAMICS,
RHODE-SAINT-GENESE (BELGIUM).**
Analytical characteristics methods: Applications
[VKI-PREPRINT-1980-10] p0021 N81-10011
Inlet flow in centrifugal pumps at partial
deliveries
[VKI-PREPRINT-1979-16] p0031 N81-10437

YOUNGSTOWN STATE UNIV., OHIO.
Control augmentation for lateral control wheel
steering
[NASA-CR-164664] p0549 N81-29132

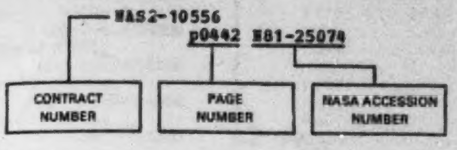
CONTRACT NUMBER INDEX

AERONAUTICAL ENGINEERING / *A Continuing Bibliography*

1981 Cumulative Index

JANUARY 1982

Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the *IAA* accession numbers appearing first. Preceding the accession number is the page number where the citation may be found.

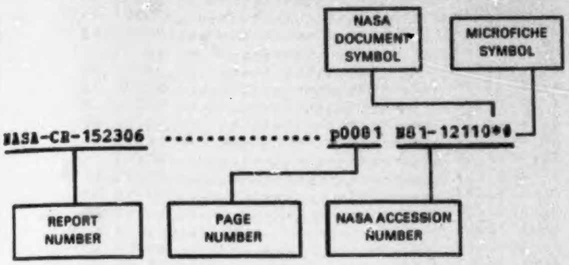
REPORT/ACCESSION NUMBER INDEX

AERONAUTICAL ENGINEERING/*A Continuing Bibliography* JANUARY 1982

1981 Cumulative Index

Typical Report/Accession Number Index Listing



Listings in this index are arranged alphanumerically by report number. The issue and page number indicate the actual Supplement and page where the citation may be located. The accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

		6. Performing Organization Code
7. Author(s)		8. Performing Organization Report No.
		10. Work Unit No.
9. Performing Organization Name and Address National Aeronautics and Space Administration Washington, DC 20546		11. Contract or Grant No.
		13. Type of Report and Period Covered
12. Sponsoring Agency Name and Address		14. Sponsoring Agency Code

15. Supplementary Notes

16. Abstract

This bibliography is a cumulative index to the abstracts contained in NASA SP-7037 (132) through NASA SP-7037 (143) of Aeronautical Engineering: A Continuing Bibliography. NASA SP-7037 and its supplements have been compiled through the cooperative efforts of the American Institute of Aeronautics and Astronautics (AIAA) and the National Aeronautics and Space Administration (NASA). This cumulative index includes subject, personal author, corporate source, contract, and report number indexes.

AERONAUTICAL ENGINEERING

A CONTINUING BIBLIOGRAPHY WITH INDEXES

(Supplement 145)

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in January 1982 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA).*

NASA Scientific and Technical Information Branch 1982
National Aeronautics and Space Administration
Washington, DC

This supplement is available as NTISUB/141/093 from the National Technical Information Service (NTIS), Springfield, Virginia 22161 at the price of $5.00 domestic; $10.00 foreign.

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971.

This supplement to *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 326 reports, journal articles, and other documents originally announced in January 1982 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries*, in that order. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* and *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes -- subject, personal author, and contract number -- are included.

An annual cumulative index will be published.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A82-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at $8.00 per document. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand, and at the rate of $1.35 per microfiche for standing orders for all *IAA* microfiche.

Minimum air-mail postage to foreign countries is $2.50 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N82-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26.1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

- Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

ICING TUNNEL TEST OF A GLYCOL-EXUDING POROUS LEADING EDGE ICE PROTECTION SYSTEM ON A GENERAL AVIATION AIRFOIL Final Report
David L. Kohlman, William G. Schweikhard, and Alan E. Albright
Sep. 1981 37 p refs
(Grant NAG3-71)
(NASA-CR-165444; KU-FRL-464-1) Avail: NTIS
HC A03/MF A01 CSCL 01C

Test results show that the system is very effective in preventing ice accretion (anti-ice mode) or removing ice from an airfoil. Minimum glycol flow rates required for antiicing are a function of velocity, liquid water content in the air, ambient temperature, and droplet size. Large ice caps were removed in only a few minutes using anti-ice flow rates, with the shed time being a function of the type of ice, size of the ice cap, angle of attack, and glycol flow rate. Wake surveys measurements show that no significant drag penalty is associated with the installation or operation of the system tested. T.M.

A82-11317 # **Development of aircraft production engineering discipline at IIT, Bombay.** N. K. Naik (Indian Institute of Technology, Bombay, India). *Aeronautical Society of India, Journal,* vol. 31, Feb.-Nov. 1979, p. 119-125.

The aircraft production engineering courses offered at the Indian Institute of Technology, in Bombay, are discussed. To demonstrate the value of the courses, the fundamentals of aircraft production are outlined, the discussion being confined to airframe production. The loft-template method is described, and the principal loft-template scheme used in aircraft production is shown. Also described are the theory and laboratory courses offered at the institute. C.R.

AERONAUTICAL ENGINEERING *A Continuing Bibliography (Suppl. 145)*

FEBRUARY 1982

IAA ENTRIES

A82-10049 **Three navigation systems and their costs of acquiring remote sensing data.** D. L. Hawley (EG & G, Inc., Las Vegas, NV). In: American Society of Photogrammetry, Annual Meeting, 46th, St. Louis, MO, March 9-14, 1980, ASP Technical Papers. Falls Church, VA, American Society of Photogrammetry, 1980, p. 426-431.

Three types of navigational systems have been analyzed and evaluated as to their capabilities for data acquisition. Two basic systems, visual navigation and strobe-aided navigation, are useful for daylight photographic flights. One additional system, more technical, is the microwave ranging system, crucial to the acquisition of multiple nighttime scanner data flights. These systems have been analyzed as to their capabilities and costs. A table of mission requirements and navigation techniques is presented. These types of studies are not unique, however in this paper, the information is presented in a comparison unique to the equipment involved. This comparison is presented relating the cost of the navigation systems and the costs of their use. The result is a time and dollar comparison of these navigation systems. (Author)

A82-10081 # **KC-135 Avionics Modernization Hot Bench.** J. L. Archdeacon and C. E. Wilent (TRW Defense and Space Systems Group, Dayton, OH). In: Computers in Aerospace Conference, 3rd, San Diego, CA, October 26-28, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 32-40. 10 refs. Contract No. F33600-80-C-0473. (AIAA 81-2105)

The U.S. Air Force has embarked upon an avionics update program for the KC-135 Stratotanker fleet. An overview is provided of the KC-135 Avionics Modernization Hot Bench (AMHB). The objective of the AMHB is to support conceptual definition of a representative KC-135 modernized avionics system. The KC-135 AMHB consists of the Modernization Avionics Suite (MAS), Environmental Systems Simulation (ESS), and the Hot Bench Monitor (HBM). Attention is given to actual avionics hardware, simulated avionic subsystems, avionic application tasks, system control, cockpit device management, guidance and performance management, flight plan management, backup control, and hot bench performance monitoring. The navigation system is also considered. TACAN, Doppler, and Digital Scan Converter data are preprocessed and compared with INS data. G.R.

A82-10082 * # **HiMAT onboard flight computer system architecture and qualification.** A. F. Myers, M. R. Earls (NASA, Flight Research Center, Edwards, CA), and L. A. Callizo (Rockwell International Corp., Los Angeles, CA). In: Computers in Aerospace Conference, 3rd, San Diego, CA, October 26-28, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 41-54. (AIAA 81-2107)

Two highly maneuverable aircraft technology (HiMAT) remotely piloted research vehicles (RPRV's) are being flight tested at NASA Dryden Flight Research Center, Edwards, California, to demonstrate and evaluate a number of technological advances applicable to future fighter aircraft. Closed-loop primary flight control is performed from a ground-based cockpit utilizing a digital computer and up/down telemetry links. A backup flight control system for emergency operation resides in one of two onboard computers. Other functions of the onboard computer system are uplink processing, downlink processing, engine control, failure detection, and redundancy management. This paper describes the architecture, functions, and flight qualification of the HiMAT onboard flight computer systems. (Author)

A82-10083 # **Synchronous fault-tolerant flight control systems.** T. B. Smith (Charles Stark Draper Laboratory, Inc., Cambridge, MA). In: Computers in Aerospace Conference, 3rd, San Diego, CA, October 26-28, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 55-60. 5 refs. (AIAA 81-2109)

Synchronous fault-tolerant systems have some unique advantages over asynchronous systems, particularly as the flight control task becomes more complex. One of the advantages is related to channel fault-detection. Asynchronous systems must rely upon setting fault thresholds for detecting computational failure within a channel. The design of the threshold can be a difficult problem. There is a rule that a fault must be present for a number of frames to be significant. These problems are largely avoided with synchronous systems, outputs are identical, and a single test of exact agreement is a perfect test. Noisy and skew effects which plague asynchronous fault detection have no effect. Other advantages of synchronous fault-tolerant systems are related to sensor fault-detection and multimode operation. Attention is given to the reasons for the present preponderance of asynchronous designs, and the use of tightly synchronized processing. G.R.

A82-10096 # **Integration of computer graphics design with analytical models.** R. J. Ricci (Lockheed-California Co., Burbank, CA). In: Computers in Aerospace Conference, 3rd, San Diego, CA, October 26-28, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 144-149. (AIAA 81-2134)

The development of Computer-Augmented Design and Manufacturing (CADAM), an interactive computer graphics system is discussed. The system is used throughout the design process from conceptual design through product support. In the conceptual design phase, basic three-view general arrangement drawings are developed. These can be quickly and accurately converted into a three-dimensional mathematical surface definition. From this information, analysis data models are generated semi-automatically for input to batch computing programs. Major areas where analysis modelers have been developed include: parametric mission analysis, aerodynamic drag modelers, structural finite element modelers, 1 g load and mass distribution modelers, fuel tank and volume analyzers, and weight and balance modelers. (Author)

A82-10100 # **The Space Shuttle vehicle checkout involving flight avionics software.** J. T. B. Mayer (Intermetrics, Inc., Cambridge, MA). In: Computers in Aerospace Conference, 3rd, San Diego, CA, October 26-28, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 173-178. (AIAA 81-2141)

A description is presented of the process employed in generating a vehicle test using the flight avionics software. The three types of onboard software available to the verification engineer include flight avionics software, vehicle utility software, and dynamic integrated test software. In most cases the flight software was modified to perform the desired functions in a manner devised by the test engineer. Attention is given to vehicle test development, test verification, vehicle test execution, and vehicle test considerations. The reported investigation shows that it should be possible in future systems to control the cost of verification and checkout by designing the verification process in conjunction with the operational software. There are operational tradeoffs that can greatly reduce the costs of verification, which in the long run can reduce the total program cost. G.R.

A82-10101 # **Bridging the gap from aircraft to space computers.** P. Mitchell and C. Vicek (Itek Corp., Applied Technology Div., Sunnyvale, CA). In: Computers in Aerospace Conference, 3rd, San Diego, CA, October 26-28, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 179-186. 7 refs. (AIAA 81-2142)

This paper investigates the design problems associated with avionics and space computers, and identifies those which are common to both, versus those which are unique to a specific application. Based on historical developments and predictions of future needs, a plan is presented which resolves many of these problems and supports real-time technology insertion in a low cost, rapid deployment approach. A computer development program is described which utilizes a modular family of functional elements, allowing a wide variety of space and aircraft requirements to be met using common hardware. Continuing development activities have expanded this system architecture into a highly fault tolerant and flexible family of computers with incremental design steps depending heavily on existing qualified hardware and software elements. (Author)

A82-10104 # **Airborne associative processor /ASPRO/.** T. DiGiacinto (Goodyear Aerospace Corp., Digital Technology Dept., Akron, OH). In: Computers in Aerospace Conference, 3rd, San Diego, CA, October 26-28, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 202-205. (AIAA 81-2145)

The ASPRO associative processor is designed for an airborne early warning radar surveillance, command and control application. It augments the existing data processors aboard a surveillance aircraft. The functional requirements of ASPRO call for extraordinary processing capacity for its volume, weight and power constraints (less than 1/2 cubic foot). ASPRO development was made feasible by designing the architecture to make use of available LSI components for arithmetic operations, addressing, program and interrupt control. The memory and parallel processing sections of ASPRO required development of two special components, a multichip memory package, and a custom 32-PE chip for the parallel processor. (Author)

A82-10116 # **Controlling the software/hardware interface for the validation of avionics systems.** T. G. Lahn and E. R. Rang (Honeywell, Inc., Minneapolis, MN). In: Computers in Aerospace Conference, 3rd, San Diego, CA, October 26-28, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 283-287. (AIAA 81-2159)

A methodology is outlined for designing critical embedded avionics by exposing the hardware/software interface during the design and validation of the system. The proposed approach involves the development of a finite-state machine representation for the control of flow of the system's functions and implementation of the finite-state machine by hardware and software. This produces a complete structure that is easy to review and validate. The approach is demonstrated for a triply-redundant flight augmentation system. V.L.

A82-10120 # **Automated Paint and Process Line /APPL/.** N. E. Manion (Lockheed-Georgia Co., Marietta, GA). In: Computers in Aerospace Conference, 3rd, San Diego, CA, October 26-28, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 319, 321, 323 (3 ff.). (AIAA 81-2166)

In an effort to control costs, the military and industry are pursuing ways to improve production efficiency by increasing the degree of automation of factory operated chemical processing and painting facilities used in the fabrication of aircraft parts. These parts, and especially those of major weapon systems, are not, however, easily amenable to automation. Critical operations are automated by a five-level control hierarchy developed for a new Automated Paint and Process Line with advanced software which provides operating flexibility. A variety of part sizes and shapes are transformed into uniform handling units by special part holders. The chemical processing computer is programmed to handle ten loads of work simultaneously. A painting robot is programmed by painting a selected target with a spray gun attached to the arm of the manipulator with the robot in a 'teach' mode. Systems will be added later to automatically track shop orders and control chemical solutions. J.F.

A82-10125 # **Use of Space Shuttle technology in conventional aircraft.** W. A. Ragsdale (Intermetrics, Inc., Houston, TX). In: Computers in Aerospace Conference, 3rd, San Diego, CA, October 26-28, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 358-361. 7 refs. (AIAA 81-2176)

A number of advances in the state-of-the-art for aircraft systems and procedures have been implemented in the Space Shuttle. Much of the new technology used would benefit conventional aircraft, especially airliners. Automatic systems management as employed for the Shuttle would simplify the task of flying an airliner. The pilot is given by the computer only the information he needs to know. The area navigation (RNAV) system used by the Space Shuttle is three-dimensional RNAV. It steers the Space Shuttle not only to a latitude and longitude, but to a specific altitude. The use of a four-dimensional RNAV, including also the monitoring of time, would provide additional advantages. A use of RNAV systems in aircraft makes possible savings in the consumption of fuel and leads to simplifications in air traffic control. Further reduction in fuel consumption can be obtained with the aid of energy management approaches. Additional advantages for aircraft operations can be obtained by the employment of the Microwave Landing System and digital fly-by-wire flight controls. G.R.

A82-10126 # **A microprocessor-based data acquisition system for stall/spin research.** M. Sri-Jayantha and R. F. Stengel (Princeton University, Princeton, NJ). In: Computers in Aerospace Conference, 3rd, San Diego, CA, October 26-28, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 362-372. 25 refs. Research supported by the Shultz Foundation. (AIAA 81-2177)

Accurate data are necessary for the identification of aerodynamic parameters at high angle of attack and in spinning flight. Modern sensors and microelectronic devices are employed in a stall/spin data acquisition system that will be tested in a Schweizer 2-32 sailplane. This instrumentation package will use a quaternion-based 'strapdown IMU' algorithm to derive vehicle attitude from angular rate data, and it will use fault-detection logic to identify in-flight sensor failures. Details of the system and flight test program are presented, together with results of pre-flight digital simulation analysis. (Author)

A82-10127 # **Real-time, on-line digital simulation of optimum maneuvers of supersonic aircraft.** C.-F. Lin (Applied Dynamics International, Ann Arbor, MI). In: Computers in Aerospace Conference, 3rd, San Diego, CA, October 26-28, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 373-381. (AIAA 81-2178)

This paper discusses real-time simulation of automatic guidance and control computer system of a supersonic fighter including a complete simulation of the mission computer and the flight control computer before connecting them as hardware in the loop. In this simulation the mission computer generates real-time, on-line optimal trajectories. These trajectories include maximum range glide and minimum time zoom climb. They are then tracked by the flight control computer. For this kind of simulation it is essential that the computational speed be very fast, thus a very fast computer with real-time, on-line capabilities is used for the simulation. Results of the simulation show that the mission computer is capable of generating online optimal trajectories much faster than real time, and that the flight control computer is capable of following very closely these trajectories at the same speed. (Author)

A82-10140 # **Performance analysis of enroute air traffic control computers in the National Airspace System.** J. Press (FAA, Systems Research and Develooment Service, Atlantic City, NJ). In: Computers in Aerospace Conference, 3rd, San Diego, CA, October 26-28, 1981, Collection of Technical Papers.
New York, American Institute of Aeronautics and Astronautics, 1981, p. 485-495. 12 refs. (AIAA 81-2203)

This paper describes a computer performance analysis recently completed at the Federal Aviation Administration Technical Center for all twenty enroute air traffic control centers in the National Airspace System. Based on linear regression, the analysis relied on field data collected nationwide in order to quantify the performance of the central computer complex operating at each facility. The data was recorded every minute for several days while the computers were supporting air traffic control operations. Graphs and tables summarize the study's results which will serve as a basis for management plans concerning future system acquisition. As a major conclusion, the methodology developed in this study applies consistently to all enroute traffic control centers. (Author)

A82-10143 # **Interoperability testing of decentralized command, control, communications and intelligence /C3I/ systems.** E. G. Ries (System Development Corp., McLean, VA) and R. C. Bjorklund (USAF, Tactical Air Command, Langley AFB, VA). In: Computers in Aerospace Conference, 3rd, San Diego, CA, October 26-28, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 513-520. 8 refs. (AIAA 81-2205)

The testing of complex, real-time C3I systems by conventional methods requires considerable resources, time, and realistic operational conditions. The decentralization of systems among diverse locations imposes further demands. Tactical Air Command is developing the Simulation, Monitoring, and Analysis, Reduction, and Test System (SMARTS) to provide a controlled test environment for C3I systems, a design incorporating an operations-scenario generator for efficient test design and analysis. SMARTS is a flexible test platform for Air Force and Joint interoperability testing, configuration management, system testing, and software maintenance. The design of SMARTS provides intercommunications between geographically separated test nodes, test control, recording, analysis, and simulation of radar and data communications for a synchronized test environment. (Author)

A82-10214 * **Downbursts and microbursts - An aviation hazard.** T. T. Fujita (Chicago, University, Chicago, IL). In: Conference on Radar Meteorology, 19th, Miami Beach, FL, April 15-18, 1980, Preprints. Boston, MA, American Meteorological Society, 1980, p. 94-101. 12 refs. NSF Grant No. ATM-78-01074; Grants No. NOAA-04-4-158-1; No. NGR-14-001-008.

Downburst and microburst phenomena occurring since 1975 are studied, based on meteorological analyses of aircraft accidents, aerial surveys of wind effects left behind downbursts, and studies of sub-mesoscale wind systems. It is concluded that microbursts beneath small, air mass thunderstorms are unpredictable in terms of weather forecast. Most aircraft incidents, however, were found to have occurred in the summer months, June through August. An intense microburst could produce 150 mph horizontal winds as well as 60 fps downflows at the tree-top level. The largest contributing factor to aircraft difficulties seemed to be a combination of the headwind decrease and the downflow. Anemometers and/or pressure sensors placed near runways were found effective for detecting gust fronts, but not for detecting downbursts. It is recommended that new detection systems placed on the ground or airborne, be developed, and that pilots be trained for simulated landing and go-around through microbursts. J.F.

A82-10215 **Applications of conventional and Doppler radars for aviation safety.** J. T. Lee and K. E. Wilk (NOAA, National Severe Storms Laboratory, Norman, OK). In: Conference on Radar Meteorology, 19th, Miami Beach, FL, April 15-18, 1980, Preprints. Boston, MA, American Meteorological Society, 1980, p. 102-109. 24 refs.

Past and present efforts at the National Severe Storms Laboratory to help provide improved operational procedures for aviation support are summarized. Quantitative data presentation and information assimilation now have greater importance, since Doppler radar is evolving toward operational use by weather services. Wind shear, vortices, and turbulence, which constitute weather hazards to aviation, must be identified and measured, and effective ways to disseminate information on the location, intensity, and movement of these hazards to the forecaster and pilot must be found. Despite the progress made thus far, research is still required to better validate radar signatures which identify storm hazards uniquely; even greater advances are needed in the design of displays and types of data parameterizations which will present significant information efficiently to the interpreter. It is suggested that user requirements be included in the designs of future radar systems at an early stage to reduce irrelevant information which complicates displays. J.F.

A82-10217 **Description of the meteorological research radar system aboard NOAA/Research Facilities Center WP-3D aircraft.** J. D. DuGranrut (NOAA, Environmental Research Laboratories, Miami, FL). In: Conference on Radar Meteorology, 19th, Miami Beach, FL, April 15-18, 1980, Preprints.
Boston, MA, American Meteorological Society, 1980, p. 115-117.

The radar system developed for the Research Facilities Center's WP-3D airborne research platform provides data from three radar sets recorded on computer-compatible media: the nose radar scans horizontally over the range + or - 120 deg from the aircraft, heading at tilt angles of + or - 20 deg from the horizon. It operates at C-band frequency (5445 MHz) and has a processed range of 100 nautical miles. The lower fuselage radar scans a full 360 deg horizontally at tilt angles of + or - 10 deg from the horizon; it also operates at C-band frequency (5370 MHz) and has a processed range of 200 nautical miles. The tail radar scans a plane perpendicular to the longitude axis of the aircraft; it operates at X-band frequency (9315 MHz) and has a processed range of 50 nautical miles. The data processing equipment of the radar data system is controlled by video integrator processors, scan converter display units, and magnetic tape units. The radars may be operated without the data system for display of weather avoidance and navigation information when data processing and recording are not required. A more detailed description is given of the receiver/transmitters, the antennas and antenna control units, the video integrator processors, the recording system, and the real-time display system. J.F.

A82-10219 **Airborne weather radar and severe weather penetration.** J. I. Metcalf (Georgia Institute of Technology, Atlanta, GA). In: Conference on Radar Meteorology, 19th, Miami Beach, FL, April 15-18, 1980, Preprints. Boston, MA, American Meteorological Society, 1980, p. 125-129. 6 refs.

The effect of rain on airborne weather radar performance and its practical implications are examined. It is shown that whenever the actual reflectivity is greater than 45 dBZ (rainfall rate in excess of 25 mm/hr), significant attenuation (greater than 0.5 dB/km one way) can be expected, leading to major distortions of the reflectivity pattern observed with a 3-cm radar. Examples discussed illustrate the need for aircrews to obtain additional weather information including data from ground-based weather radars at any time when the on-board radar shows weather echoes near the projected flight path, particularly when weather penetration is contemplated. V.L.

A82-10220 * **An airport wind shear detection and warning system using Doppler radar.** J. McCarthy (National Center for Atmospheric Research, Boulder, CO), W. Frost, B. Terkel (Tennessee, University, Tullahoma, TN), R. J. Doviak (NOAA, National Severe Storms Laboratory, Norman, OK), D. W. Camp (NASA, Marshall Space Flight Center, Huntsville, AL), E. F. Blick, and K. L. Elmore (Oklahoma, University, Norman, OK). In: Conference on Radar Meteorology, 19th, Miami Beach, FL, April 15-18, 1980, Preprints. Boston, MA, American Meteorological Society, 1980, p. 135-142. 7 refs. NSF Grants No. ATM-74-03406-A02; No. ATM-78-12401; Contracts No. NAS8-31377; No. NAS8-33458.

Two numerical models of aircraft performance are developed to relate atmospheric wind signals in wind-shear situations to aircraft response. Both models produce time histories of pitch angle, airspeed, height above the ground, and other parameters for simulating aircraft making precision approaches along a 3-deg glide slope to the runway. Simulations conducted using thunderstorm environment wind data indicate that the horizontal wind component is at least as important as the vertical component in determining aircraft response to wind shear. Obtaining quantitative measurements of aircraft approach or departure quality is found to depend on several factors, including the knowledge of winds along the expected flight track, clear-air detection in a quasi-horizontal path, and a near continuous estimate of approach deterioration due to shear conditions. D.L.G.

A82-10221 * **Instrumented aircraft verification of clear-air radar detection of low-level wind shear.** J. McCarthy (National Center for Atmospheric Research, Boulder, CO), K. L. Elmore (Oklahoma, University, Norman, OK), R. J. Doviak, and D. S. Zrnic (NOAA, Severe Storms Laboratory, Norman, OK). In: Conference on Radar Meteorology, 19th, Miami Beach, FL, April 15-18, 1980, Preprints. Boston, MA, American Meteorological Society, 1980, p. 143-149. NSF Grants No. ATM-74-03406-A02; No. ATM-78-12401; Contracts No. NAS8-31377; No. NAS8-33458.

A technique is described in which the longitudinal wind component at airports, measured by Doppler radar, is put through a Fourier transformation to produce an energy density spectrum. The result is multiplied by the aircraft response characteristics to produce quantitative data on aircraft performance in a wind shear situation. The Doppler radar measurements are made along the intended flight path. Two case studies, along a 3 deg approach path, are described from measurements in two modes: Lagrangian, where predictions were computed one range gate ahead of the plane, and Eulerian, where samples were measured instantaneously along the flight path. Wind data obtained every second were interpolated to fit a numerical model by using a cubic spline. Eulerian data were superior to Lagrangian data in terms of ranging, and nearly equal for wind speeds. Improvements in current 75% accuracy are noted to be possible with shrouded antennas to reduce sidelobes and use of Doppler radar with higher resolution to eliminate effects of small scale disturbances within the pulse volume. M.S.K.

A82-10222 **Detection and display of wind shear and turbulence.** J. Wilson, R. Carbone, and R. Serafin (National Center for Atmospheric Research, Boulder, CO). In: Conference on Radar Meteorology, 19th, Miami Beach, FL, April 15-18, 1980, Preprints. Boston, MA, American Meteorological Society, 1980, p. 150-156. 9 refs.

Displays of wind shear are given which are obtained by a method for certain cases collected by NCAR 5 cm wavelength radars. A Doppler radar located at an airport or in an aircraft measures the wind shear along flight paths on scales critical to aircraft operations. The magnitude of the shear on the desired scale is then obtained by measuring the wind shear over a distance of one-half the aircraft phugoid wavelength. Four cases classified as severe storms show that significant wind changes occur within 0.5 to 3.0 km, which includes the phugoid wavelength of modern aircraft. It is suggested that a practical solution for the detection of hazardous wind shear is to locate a scanning Doppler at an airport so that quantitative displays of wind changes at the phugoid wavelength can be generated. D.L.G.

A82-10223 **Gust front structure observed by Doppler radar.** R. J. Donaldson, Jr. and C. L. Bjerkaas (USAF, Geophysics Laboratory, Bedford, MA). In: Conference on Radar Meteorology, 19th, Miami Beach, FL, April 15-18, 1980, Preprints. Boston, MA, American Meteorological Society, 1980, p. 157-161. 6 refs.

Two gust fronts (April 30 and May 2, 1978) are discussed as representative samples of operational data taken during the Joint Doppler Operational Project of 1977-1979. Readings from the 10 cm Doppler radar at Norman, OK, during continuous recording at five or six elevation angles were color coded and displayed for speeds in m/s, range marked at one km intervals, and dated, with time of day indicated. Charts provided show wind direction changes with the passage of a gust front and windspeeds at 0.3 km altitude to be double that of surface wind speeds, a factor considered important for aviators. Extreme wind shears within the fronts were taken as evidence for severe vertical shears, which were not sensed by horizontally scanning radar. The effectiveness of the Doppler radar in identifying and ranging gust fronts commends it to airport use, where shears invisible to the pilot's eye can be hazardous during takeoff and approach maneuvers at low altitudes. M.S.K.

A82-10225 **The evolution of airborne weather avoidance radar toward a calibrated remote rain gauge using REACT.** J. F. Clark (RCA, Princeton, NJ). In: Conference on Radar Meteorology, 19th, Miami Beach, FL, April 15-18, 1980, Preprints. Boston, MA, American Meteorological Society, 1980, p. 169-175. 5 refs.

REACT (Rain Echo Attenuation Compensation Technique) is a new digital system that compensates for precipitation attenuation in each small-range increment of each sweep by adaptively increasing the radar receiver sensitivity for the next range increment by an amount equal to the two-way attenuation through the original range increment. A Probable Ground Track and Weather Radar Plot of the Apr. 4, 1977 storm near New Hope, GA was published and used as the ground truth in plotting rainfall data. The storm was first depicted by conventional X-band and C-band radar, and the resolution and range of these bands are compared. REACT was then used with the PriMUS 708 solid-state radar; the plotted result of precipitation attenuation was shown to agree well with the assumed ground truth. The PriMUS 708 airborne radar, compensated with REACT, combines the X-band advantage of higher resolution and antenna gain with an accurate rainfall rate calibration. J.F.

A82-10292 **Multiple Doppler radar observations of PBL structure.** P. H. Hildebrand (National Center for Atmospheric Research, Boulder, CO). In: Conference on Radar Meteorology, 19th, Miami Beach, FL, April 15-18, 1980, Preprints. Boston, MA, American Meteorological Society, 1980, p. 656-661. NSF Grant No. ATM-76-24236.

It is noted that during May and June of 1977, multiple Doppler radars, aircraft and other instrumentation were used to observe the characteristics of the convectively growing planetary boundary layer (PBL) in Central Oklahoma. The observations were made between midmorning and afternoon when the PBL was growing quickly. A preliminary analysis of the data from one of the days is given. It is found that data collected using such a large radar separation appear to be usable to describe large scale PBL kinematics. C.R.

A82-10304 **Helicopter engine technology - With particular reference to the Rolls-Royce Gem engine.** D. Lewis (Rolls-Royce, Ltd., Watford, Herts., England). *Aeronautical Journal,* vol. 85, Sept. 1981, p. 313-319.

A description is presented of the design features incorporated by the Rolls-Royce Gem helicopter engine in light of the following criteria: (1) high structural strength, to withstand low frequency vibration and maneuvering loads; (2) optimization of low altitude performance; (3) operation over a wide power range; (4) high fuel efficiency at part load power; (5) fast and surge-free acceleration and deceleration; (6) insensitivity to intake pressure disturbances; (7) resistance to contaminated intake air; and (8) stability of control. It is observed that in general, the complexities introduced into helicopter engines of the last design generation to improve fuel consumption will be diminished in the next generation of engines for the sake of cost reduction. In addition to the Gem, these engines include the GE T700 and U.S. Army ATDE. O.C.

A82-10305 **The application of improved aluminium alloys and steels in aircraft structures.** C. J. Peel and D. S. McDarmaid (Royal Aircraft Establishment, Materials Dept., Farnborough, Hants., England). *(Royal Aeronautical Society, Symposium on Developments in Structures and Manufacturing Techniques, London, England, Apr. 14, 1981.) Aeronautical Journal,* vol. 85, Sept. 1981, p. 320-326. 16 refs.

It is shown that development efforts in aircraft aluminum alloys and steels over the last 20 years have generally sought to overcome such problems as a lack of resistance to fatigue and stress corrosion cracking rather than achieve increases in specific strength. Significant improvements in fracture toughness and stress corrosion resistance have been achieved, and improved surface treatments are appearing for steel products. Attention is given to new aluminum alloys resulting from the addition of up to 3 wt % Li to Al-Mg, Al-Cu, and Al-Cu-Mg systems, yielding increased stiffness and reduced density. Improvements to 2000- and 7000-series aluminum alloys, rapid solidification production techniques, and corrosion protection for aircraft steels are also covered. O.C.

A82-10306 **Design aspects of non rigid airship envelopes.** J. A. I. Reid (Airship Industries, Ltd., London, England). *(Royal Aeronautical Society, Symposium on Developments in Structures and Manufacturing Techniques, London, England, Apr. 14, 1981.) Aeronautical Journal,* vol. 85, Sept. 1981, p. 327, 328.

The design requirements of nonrigid airship envelopes are addressed in light of recent advances in both (1) the estimation of airship hull loadings under maneuvering and gusts and (2) high-strength fabrics for airship construction woven from polyamide, polyester, and Kevlar fibers. Attention is given to the degree of permeability by helium of hull and ballonet materials. When determining safety factors for use with such nonmetallic materials, a factor characterizing the degradation of material strength with age must be added to those normally associated with strength calculations. O.C.

A82-10307 **Some possibilities for composite light aircraft construction.** J. H. Webb (Cranfield Institute of Technology, Cranfield, Beds., England). *(Royal Aeronautical Society, Symposium on Developments in Structures and Manufacturing Techniques, London, England, Apr. 14, 1981.) Aeronautical Journal,* vol. 85, Sept. 1981, p. 328-331.

Alternative methods for the design and construction of light aircraft and remotely piloted vehicles with composite materials are described, with attention to the minimization of tooling, materials and construction man-hour costs. A four-seat, single-engine light aircraft is assumed for comparison of conventional metal and glass-reinforced plastic composite wing structure construction costs. Weight comparisons are also presented for three novel wing structure design concepts: (1) a tubular spar with plastic foam core and fiberglass-reinforced skin; (2) a similar arrangement incorporating a metal spar; and (3) fiberglass-reinforced plastic foam sandwich skins with a metal spar. The mixed metal/plastic composite structure is incorporated into the Machan RPV, and has proven to be satisfactory in recent flight trials. O.C.

A82-10308 **Light aircraft structural design in non-metallics - Use of composite honeycomb for light aircraft.** G. E. Woodley (Ciba-Geigy Plastics and Additives Co., Duxford, Cambs., England). *(Royal Aeronautical Society, Symposium on Developments in Structures and Manufacturing Techniques, London, England, Apr. 14, 1981.) Aeronautical Journal,* vol. 85, Sept. 1981, p. 332, 333.

Recommendations are made toward the application of high-technology prepreg composite systems for the production of nonmetallic honeycomb light aircraft structures. Attention is given to design and assembly methods for wings and control surfaces, with emphasis on the reduction of production costs rather than weight saving. It is shown that the designer's aim should cut down the honeycomb panel piece parts required, thereby reducing the man-hours cost of production, and that the use of composite honeycomb materials results in a more damage-tolerant surface than conventional light aircraft structures, with a more accurate overall shape and reductions of both corrosion and fatigue. O.C.

A82-10309 **Sophisticated aircraft structure developments - Combat aeroplanes.** R. J. Sellars and G. Terry (British Aerospace Public, Ltd., Co., Warton Div., Preston, Lancs., England). *(Royal Aeronautical Society, Symposium on Developments in Structures and Manufacturing Techniques, London, England, Apr. 14, 1981.) Aeronautical Journal,* vol. 85, Sept. 1981, p. 334-342. Research supported by the Ministry of Defence (Procurement Executive).

Comparisons of the structural materials and fabrication processes currently under development and assessment in Britain for future combat aircraft construction are presented, with attention to the demonstration of carbon fiber reinforced composites (CFC) and superplastic forming/diffusion bonding of titanium alloy (SPF/DB) in existing aircraft. CFC and SPF/DB structures are compared with respect to specific tensile and compressive strengths and moduli, specific shear strength and modulus, buckling, and ultimate design strengths and design criteria in the application of the materials to the stabilized skins of combat-aircraft surfaces. Emphasis is put on the possibility of aeroelastic tailoring that is introduced by the application of CFC to wing structures. O.C.

A82-10310 **Optimal flight paths for winged, supersonic flight vehicles - Extension to the casc where thrust can be vectored.** E. Large (Marconi Space and Defence Systems, Ltd., Stanmore, Middx., England). *Aeronautical Journal,* vol. 85, Sept. 1981, p. 343-348. 5 refs.

A method for determining the optimal trajectory and thrust program of an aircraft or rocket employing vectored thrust is derived, for the practical cases in which the entire thrusting phase is supersonic. It is shown that finding the burning program which gives the Hamiltonian function a zero value automatically satisfies the optimal flight path conditions and makes the final fuel consumption independent of time. It is found that the optimal burning program is not, except in special cases, one that employs constant thrust, the general optimum instead being a linear rate of thrust increase with time. O.C.

A82-10362 # **The use of the Weber method for minicomputer-assisted numerical analysis of airfoils (Zastosowanie metody Webera do numerycznej analizy aerodynamicznej profili na minikomputerach).** K. Czyzewski and M. Lukaszewicz. *Instytut Lotnictwa, Prace,* no. 85, 1981, p. 9-21. 21 refs. In Polish.

A numerical version of the Weber method is developed for calculating pressure distribution over an airfoil in subsonic flow. The method is based on the fact that singularities representing the flow at the airfoil surface are distributed chordwise, and a correction coefficient is introduced, with allowance for airfoil thickness. If the airfoil shape is approximately represented by spline functions, numerical analysis is simplified considerably and the accuracy is improved. The present numerical results are compared with other numerical results for subcritical and supercritical flow conditions, and with wind-tunnel-test results. In addition, an iteration method for determining the critical Mach number has been developed. B.J.

A82-10363 # **Experimental study of subsonic and transonic flows past a wing (Eksperymentalne badania pod- i przydzwiekowego oplywu skrzydla).** W. Kania and A. Krzysiak. *Instytut Lotnictwa, Prace,* no. 85, 1981, p. 23-44. 10 refs. In Polish.

The paper reports aerodynamic balance measurements of aerodynamic characteristics and flow visualization tests on a plane trapezoidal uniform-section wing with a small sweepback angle. Tests were performed in a transonic wind tunnel for Mach numbers ranging from 0.3 to 0.96 under conditions of fixed boundary layer transition. Lift, drag, and pitching moment were determined, with attention given to the effect of Mach number. Shock wave formation on the wing is examined, and flow separation and drag rise are determined. Four types of flow separation, depending on Mach number, are revealed; it is found that there is a correlation between the type of flow separation and the value of the lift coefficient at the onset of separation, which depends on the Mach number. B.J.

A82-10364 # **Analytical determination of undercarriage retraction kinematics (Analityczne okreslanie kinematyki chowania podwozia).** R. Stanczak. *Instytut Lotnictwa, Prace,* no. 85, 1981, p. 45-53. In Polish.

An analytical method is developed for calculating the kinematics of undercarriage retraction. The method is particularly suitable for the design of high-wing and mid-wing monoplanes, the undercarriages of which cannot be attached to the wing. Attention is given to undercarriages with one and two rotation axes. B.J.

A82-10396 **FAA developing new collision avoidance, data acquisition and transmission systems.** A. C. Schwartz. *Airport Forum,* vol. 11, Aug. 1981, p. 93, 94, 96, 97.

The U.S. Federal Aviation Agency (FAA) is concerned with the development of an aircraft collision avoidance system which, it is hoped, will be universally accepted as an aviation standard system. The Discrete Address Beacon System (DABS) contains advanced flight and data link equipment. According to the FAA program, DABS is to become the basis for a ground-based collision avoidance system called the Automatic Traffic Advisory and Resolution Service (ATARS). However, it was recently decided to review the DABS ground station program before a final decision is made regarding the ground installations. Another decision is concerned with the implementation of an airborne collision avoidance system called Threat Alert and Collision Avoidance System (TCAS). The TCAS is to take the place of the Beacon Collision Avoidance System (BCAS). TCAS will operate independently of ground stations and use a highly directional transmitting antenna. To provide better information for en route air traffic controllers when the main radar system fails, FAA is installing the Direct Access Radar Channel (DARC) at its 20 centers in the continental U.S. G.R.

A82-10401 * # The balloon and the airship technological heritage. N. J. Mayer (NASA, Washington, DC). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1912.* 8 p. 7 refs.

The balloon and the airship are discussed with emphasis on the identification of commonalities and distinctions. The aerostat technology behind the shape and structure of the vehicles is reviewed, including a discussion of structural weight, internal pressure, buckling, and the development of a stable tethered balloon system. Proper materials for the envelope are considered, taking elongation and stress into account, and flight operation and future developments are reviewed. Airships and tethered balloons which are designed to carry high operating pressure with low gas loss characteristics are found to share similar problems in low speed flight operations, while possessing interchangeable technologies. D.L.G.

A82-10403 # Air bag impact attenuation system for the AQM-34V remote piloted vehicle. C. T. Turner (Teledyne Ryan Aeronautical, San Diego, CA) and L. A. Girard, Jr. (Goodyear Aerospace Corp., Akron, OH). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1917.* 8 p.

This paper describes the air bag impact attenuation system (ABIAS) for the AQM-34V remote piloted vehicle. The developed hardware, consisting of the main bag, tail bag, and inflation systems, is described. Operation of the system from electrical initiation, through cover deployment, main and tail bag inflation, and ground impact is discussed. Development ground drop tests, environmental tests, structural tests, and the contractor flight tests are summarized. Test results substantiated system performance. (Author)

A82-10404 # Limiting payload deceleration during ground impact. A. Mironer (Analytical Systems Engineering Corp., Burlington; Lowell, University, Lowell, MA), R. Urquhart (Analytical Systems Engineering Corp., Burlington, MA), and R. Walters (USAF, Geophysics Laboratory, Bedford, MA). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1918.* 7 p.

This paper considers the problem of limiting the deceleration of balloon and sounding-rocket instrument payloads during ground impact by adding energy-dissipating, deformable structures. The basic physics of the two-step deceleration/energy-dissipation process is analyzed and simple force and energy-balance relationships are developed. The pertinent equations are organized in a form that is conducive for computer computation. Two example problems, one of a sounding-rocket payload and the other of a balloon payload are calculated and the results presented in the form of a performance map. (Author)

A82-10405 # Aerodynamics and performance of cruciform parachute canopies. D. S. Jorgensen and D. J. Cockrell (Leicester, University, Leicester, England). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1919.* 10 p. 8 refs. Research supported by the Ministry of Defence (Procurement Executive).

Effects of changing the ratio of the arm length and width (the 'arm ratio') on the aerodynamics of cruciform (cross-shaped) parachute canopies are described. Forces and moments were determined from measurements made when fabric canopies were towed under water in a ship tank as well as from integrated pressure distributions determined by using specially-designed pressure transducers fixed in fabric wind tunnel models. Using both techniques, the existence of stochastic variations in aerodynamic behavior was investigated. Experimental results will be analysed using an appropriate computer performance model and the variation of dynamic performance characteristics thus determined as a function of the arm ratio. (Author)

A82-10406 # Experimental determination of parachute apparent mass and its significance in predicting dynamic stability. T. Yavuz and D. J. Cockrell (Leicester, University, Leicester, England). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloonn Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1920.* 9 p. 6 refs. Research supported by the Ministry of Defence (Procurement Executive) and Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt.

Experimental techniques to measure the components of the apparent mass tensor for parachutes are descrbed. They are evaluated by force and moment measurement during relative motion of parachutes submerged in water in a ship tank. Results show that the components depend on canopy shape, angle of attack and acceleration modulus and, except at high values of the latter, can be considerably in excess of potential flow evaluations. The effect of these results on the dynamic stability of descending parachutes is demonstrated by reference to an appropriate computer model. General conclusions are drawn relevant to canopies whose shapes differ from those tested. (Author)

A82-10407 # Development of new lifting parachute designs with increased trim angle. W. R. Bolton (Sandia Laboratories, Livermore, CA) and I. T. Holt (Sandia Laboratories, Albuquerque, NM). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1921.* 12 p. Research supported by the U.S. Department of Energy.

A development program is being conducted by Sandia National Laboratories on a lifting parachute system which allows aircraft delivery of a payload at high speed from low altitude. Candidate lifting parachute designs, which included ram air inflated leading edge chambers and flow-directing side vents, were evaluated in small and full-scale wind tunnel tests, in whirl tower flight tests, and in aircraft flight tests. The results of these testing activities will be discussed along with the method of using test results to predict system performance. (Author)

A82-10408 # The effects of flexibility on the steady-state performance of small ribbon parachute models. T. Weber (McDonnell Aircraft Co., St. Louis, MO) and W. L. Garrard (Minnesota, University, Minneapolis, MN). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1923.* 7 p. 5 refs. Research supported by the U.S. Department of Energy.

Small textile ribbon parachute models were shown to exhibit steady-state aerodynamic coefficients similar to those of rigid parachute models. Since no detailed study of the effects of model flexibility on the steady-state aerodynamic performance of a parachute model has been reported, several ribbon parachute models of varying flexibility and equal geometric porosity were constructed and tested in the wind tunnel. No correlation was found between model flexibility and measured aerodynamic performance. (Author)

A82-10409 # Comparison of simulation and experimental data for a gliding parachute in dynamic flight. T. F. Goodrick (U.S. Army, Natick Research and Development Laboratories, Natick, MA). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1924.* 5 p.

Comparisons are presented of descent rate, total airspeed, horizontal airspeed, yaw rate, pitch rate and roll rate between computer simulation in 6 DOF and flight data for a 200 square foot Parafoil of aspect ratio 2.0 carrying a 350-pound stabilized payload. The payload is specially designed to measure and record all essential parameters of dynamic flight independent of atmospheric wind. The comparison indicates a high degree of agreement in high-rate turns varying greatly from steady-state conditions. Thus, the 6 DOF simulation has been validated. (Author)

A82-10410 # Theoretical analysis of parachute inflation including fluid kinetics. J. W. Purvis (Sandia Laboratories, Albuquerque, NM). *American Institute of Aeronautics and Astronautics,* *Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1925.* 12 p. 25 refs. Research supported by the U.S. Department of Energy.

An analysis is presented for predicting parachute inflation. Equations of motion for the complete system are developed from first principles, and are solved with no experimental inputs. Ballistic equations of motion are derived for the canopy, payload, and suspension line masses. However, the enclosed fluid mass is not lumped with the canopy as an apparent mass term. Instead, the fluid conservation equations for a deforming, accelerating control volume are solved to determine the behavior of the captured fluid and its interaction with the canopy. Only first order effects are included, and the analysis is limited to inviscid, incompressible flow. Results for both porous and nonporous canopies are compared with experimental data. (Author)

A82-10411 * # **A new thermal and trajectory model for high altitude balloons.** L. A. Carlson and W. J. Horn (Texas A & M University, College Station, TX). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1926.* 10 p. 17 refs. Contract No. NAS6-3072.

A new computer model for the prediction of the trajectory and thermal behavior of high altitude balloons has been developed. In accord with flight data, the model permits radiative emission and absorption of the lifting gas and daytime gas temperatures above that of the balloon film. It also includes ballasting, venting, and valving. Predictions obtained with the model are compared with flight data and newly discovered features are discussed. (Author)

A82-10412 # **The net-skirt to a parachute canopy as a device to prevent inversion.** G. W. H. Stevens. *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1927.* 8 p. 7 refs.

The paper gives a historical account of the circumstances which led to the invention of the net-skirt extension as a device to eliminate parachute canopy inversions, in particular, partial inversions known as 'Blown Peripheries'. Because previous papers do not give a precise account of the mechanism causing the phenomenon it is reanalysed. The paper also records the trends of thought which led to the invention. The phenomenon has been completely eliminated in parachutes modified in this way. Whereas the net-skirt extension solved the difficulties with the Airborne Forces' parachuting system it does not appear to be essential for all deployment systems if adequate line tension can be maintained. Because of the paper's historical nature, Imperial units are used throughout. (Author)

A82-10413 # **The constricted rigging line trials technique for assessing the opening characteristics of parachutes.** S. A. Birch (Irvin Great Britain, Ltd., Letchworth, Herts., England). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1932.* 8 p. 7 refs.

Constricted rigging line trials of a parachute in which the relationship between the inflation time and the effective line length can be established in drop tests from an aircraft or captive kite balloon, present a simple, quick, cost effective test technique for assessing the performance of a parachute against the known performance of a similar parachute. The technique is being used by Irvin Great Britain Limited as a routine test method for man-carrying and other parachute applications. This paper describes the method of test and gives examples of applications of the technique and the results obtained. (Author)

A82-10414 # **A modular asymmetric parachute for wind tunnel testing.** P. C. Klimas, H. E. Widdows, and R. H. Croll (Sandia Laboratories, Albuquerque, NM). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1933.* 9 p. Contract No. DE-Ac04-76DP-00789.

The construction of a series of asymmetrical wind tunnel model parachutes designed to a modular concept is described. The static force, inflation force, and dynamic force and motion time history wind tunnel testing of up to 123 different configurations is discussed. (Author)

A82-10417 # **Reductions in parachute drag due to forebody wake effects.** C. W. Peterson and D. W. Johnson (Sandia Laboratories, Albuquerque, NM). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1939.* 11 p. 10 refs. Research supported by the U.S. Department of Energy.

The paper evaluates approximate analytic methods for predicting reduction in parachute drag due to forebody wake effects. Velocity distributions are measured behind realistic forebody configurations, and are compared to three turbulent wake velocity models. The velocities are integrated to determine the average effective dynamic pressure acting on the parachute, and comparisons are made of drag loss data and effective dynamic pressure ratios. Predictions are also made for no-fin and finned forebodies with 0 deg, 10 deg, and 20 deg angles of attack. The ratio of measured parachute drag behind a forebody divided by the wake free drag is found to equal the ratio of the average dynamic pressure acting on the parachute divided by the freestream dynamic pressure. Good agreement is found between wake velocity data and theoretical predictions, and the maximum angle of attack providing accurate predictions is determined. D.L.G.

A82-10420 # **Stress measurements in a ribbon parachute canopy during inflation and at steady state.** T. A. Konicke and W. L. Garrard (Minnesota, University, Minneapolis, MN). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1944.* 10 p. 9 refs. Research supported by the U.S. Department of Energy.

This paper describes the results of an experimental study of canopy stresses in a model ribbon parachute. The distribution of circumferential stress was measured during inflation and at steady state for different values of dynamic pressure. Testing was performed in the wind tunnel at the infininite mass condition. Omega sensors were used to measure stresses and were mounted in different ribbons along the gore centerline. It was found that the steady state stress had two maxima of about equal value. One maxima was near the skirt, the other half-way between the vent and skirt. The distribution of maximum stress during inflation was similar to the steady state distribution and the ratio of maximum stress during inflation to steady state stress ranged from 1.25 to 1.75 and was essentially independent of dynamic pressure. The spectral density of the steady state stress measured at several points on the canopy. (Author)

A82-10421 # **Stress measurements in bias constructed parachute canopies during inflation and at steady-state.** W. L. Garrard and T. A. Konicke (Minnesota University, Minneapolis, MN). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1945.* 10 p. 8 refs. Research supported by the U.S. Department of Energy.

This paper describes the results of an experimental study of canopy stresses in bias constructed solid flat parachutes. Stresses were measured in the warp and fill directions during inflation and at steady state for different values of dynamic pressure. Omega sensors were used to measure stress. These sensors were mounted along the gore center lines so that the warp and fill stress distributions could be determined as a function of distance from the vent. It was found that stresses in the fill direction were substantially larger than stresses in the warp direction. (Author)

A82-10425 # **Aeroballistic characteristics of sonobuoy parachute decelerators limited to a length of three feet.** C. T. Calianno (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1950.* 6 p.

Air drop and wind tunnel tests were conducted to verify the stability of sonobuoys with decelerators limited to a total length of 3 feet. This limitation was established for safety reasons. Existing decelerator systems are configured to a length of 5 to 12 feet, with cross-type canopies varying in area from 1.5 to 3.5 square feet.

Sonobuoys are blunt nose right circular cylinders, 4-7/8 inches in diameter, 36 inches long ranging in weight from 12 to 39 pounds. Testing established that 3-foot long decelerators are suitable replacements for the existing configurations. Drag coefficient, opening load, high altitude air descent characteristics, and stability data were determined for different types of decelerators with various area and length. (Author)

A82-10427 # **Development of a nylon-Kevlar recovery system for the CL-289 /AN/USD 502/ surveillance drone.** D. B. Webb and L. Palm (Irvin Industries Canada, Ltd., Fort Erie, Ontario, Canada). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1952.* 12 p.

An innovative optimized system has been developed for the automatic recovery of a small (500 lb.) high speed surveillance drone along a precise trajectory. The system requires the use of advanced materials and techniques in order to meet stringent system weight, volume and performance limitations and consists of a two stage highly pressure packed unitized parachute package plus dual landing bags. The specification weight and volume constraints made the maximum use of Kevlar material mandatory for the entire system. Other innovative techniques required included stretch fabric orifices for the landing bags and main parachute opening control features; i.e., continuously variable geometric porosity and use of a special type of auxiliary parachute (Webb chute) positioned in the mouth of the canopy. (Author)

A82-10428 # **Inflatable system for fast deployment of parachutes at low altitudes from slow moving aircraft or stationary supports.** H. O. Bucker. *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1953.* 6 p. 5 refs.

A preinflated system has been developed for fast expansion and deployment of emergency parachute canopies from buildings or slow-moving aircraft. The model is based on the concept of a quick shape recovery of restrained folded inflated flexible tubing and is tested using modified conventional circular canopies. Three suspension lines are used on buildings at altitudes as low as 25 m, with a 55 kg load. Canopies achieve full deployment at 11 m at normal landing speeds of 4.6 m/sec with a frame expansion time of 0.35 sec. Prototypes tested for slow aircraft achieve a speed of 50 km/hr, with a frame pressure of 4.3 kg/sq cm, and a deployment time of 2 sec. Results indicate that fast expansion and subsequent deployment of canopies operated with portable gas sources can be useful in such sports as hang gliding, or as emergency equipment for firemen in rescue operations. D.L.G.

A82-10455 * # **Helicopter rotor trailing edge noise.** R. H. Schlinker and R. K. Amiet (United Technologies Research Center, East Hartford, CT). *American Institute of Aeronautics and Astronautics, Aeroacoustics Conference, 7th, Palo Alto, CA, Oct. 5-7, 1981, Paper 81-2001.* 26 p. 44 refs. Contract No. NAS1-15730.

An experimental and theoretical study was conducted to assess the importance of trailing edge noise as a helicopter main rotor broadband noise source. The noise mechanism was isolated by testing a rotor blade segment in an open jet acoustic wind tunnel at close to full scale Reynolds numbers. Boundary layer data and acoustic data were used to develop scaling laws and assess a first principles trailing edge noise theory. Conclusions from the isolated blade study were analytically transformed to the rotating frame coordinate system to develop a generalized rotor noise prediction. Trailing edge noise was found to contribute significantly to the total helicopter noise spectrum at high frequencies. (Author)

A82-10456 * # **Rotor wake characteristics relevant to rotor-stator interaction noise generation.** L. M. Shaw and J. R. Balombin (NASA, Lewis Research Center, Cleveland, OH). *American Institute of Aeronautics and Astronautics, Aeroacoustics Conference, 7th, Palo Alto, CA, Oct. 5-7, 1981, Paper 81-2031.* 24 p. 23 refs.

Mean and turbulence wake properties at three axial locations behind the rotor of an aerodynamically loaded 1.2 pressure ratio fan were measured using a stationary cross film anemometer in an anechoic wind tunnel. Wake characteristics at four radial immersions across the duct at four different fan speeds were determined utilizing a signal enhancement technique. The shapes of the waveforms of the mean rotor relative and mean upwash velocities were shown to change significantly across the span of the blades. In addition, an increase in fan rotational speed caused an increase in the maximum wake turbulence intensity levels near the hub and tip. Spectral analysis was used to describe the complex nature of the rotor wake. (Author)

A82-10457 * # **Effects of vane/blade ratio and spacing on fan noise.** R. A. Kantola (General Electric Co., Power Generation Group, Lynn, MA) and P. R. Gliebe (General Electric Co., Aircraft Engine Group, Cincinnati, OH). *American Institute of Aeronautics and Astronautics, Aeroacoustics Conference, 7th, Palo Alto, CA, Oct. 5-7, 1981, Paper 81-2033.* 16 p. 11 refs. Contract No. NAS3-22062.

The effects of vane/blade ratio and spacing on fan noise are investigated to develop a fan noise prediction scheme which is calibrated against experimental data. A 44 blade, 0.504 diameter fan is used to demonstrate the production of fan noise data free from excess noise caused by rotor turbulence interaction. Two stator sets consisting of a cut-off set with 86 vanes, and a cut-on set of 48 vanes are used, with a total range of spacing from 0.5 to 2.3 rotor chords. The model includes viscous wake interaction noise and the potential field interactions of both the rotor and stator. A free-field acoustic environment is achieved by covering the walls, ceiling and floor with 0.7 m polyurethane foam wedges, providing less than + or - 1 dB standing wave ratio at 200 Hz. Only a 3 dB drop in tone level occurs as the spacing is increased from 0.5 to 2.3 rotor chords, and results indicate that the rotor wakes impinging on the stator vanes are the principal noise source for subsonic rotor speeds. D.L.G.

A82-10462 * # **Analysis of augmented aircraft flying qualities through application of the Neal-Smith criterion.** R. E. Bailey and R. E. Smith (Calspan Advanced Technology Center, Buffalo, NY). *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Albuquerque, NM, Aug. 19-21, 1981, Paper 81-1776.* 26 p. 9 refs. USAF-NASA-supported research.

The Neal-Smith criterion is examined for possible applications in the evaluation of augmented fighter aircraft flying qualities. Longitudinal and lateral flying qualities are addressed. Based on the application of several longitudinal flying qualities data bases, revisions are proposed to the original criterion. Examples are given which show the revised criterion to be a good discriminator of pitch flying qualities. Initial results of lateral flying qualities evaluation through application of the Neal-Smith criterion are poor. Lateral aircraft configurations whose flying qualities are degraded by roll ratcheting effects map into the Level 1 region of the criterion. A third dimension of the criterion for flying qualities specification is evident. Additional criteria are proposed to incorporate this dimension into the criterion structure for flying qualities analysis. (Author)

A82-10463 # **How large should a commuter transport be.** R. D. FitzSimmons, J. Seif, and S. C. Nelson (Douglas Aircraft Co., Long Beach, CA). *American Institute of Aeronautics and Astronautics, Aircraft Systems and Technology Conference, Dayton, OH, Aug. 11-13, 1981, Paper 81-1732.* 12 p. 11 refs.

Definitions of a commuter transport are examined from the viewpoint of a major airframe manufacturer. Selected milestones in commuter air service are reviewed. The impact of deregulation is creating new opportunities for commuter airlines to expand services, resulting in new economic and operating problems. Problems of acquisition and operating costs are discussed. Considerations for commuter transport capacity include number of passengers, frequency of service, airport facilities, and community compatibility. Capacity variations are explored in the 1980s and the 1990s. Some conceptual commuter transport candidates for the future are presented. (Author)

A82-10465 # **Design considerations for duty cycle, life and reliability of small limited life engines.** D. A. Gries (Williams International Corp., Walled Lake, MI). *AIAA, SAE, and ASME, Joint Propulsion Conference, 17th, Colorado Springs, CO, July 27-29, 1981, AIAA Paper 81-1402.* 4 p.

Design requirements, design criteria and verification methods related to preliminary design and program planning for small limited life turbine engines have significant differences from other engine technologies. Design operating life of components is defined by development test requirements, rather than mission life requirements. Interpolation between operating mission limits is required to demonstrate operating life for limited life engines rather than extrapolation of accelerated testing required for long life. Storage life requirements are very stringent. The correlation of reliability prediction versus accelerated verification testing for engines requiring extended dormant storage is being validated. (Author)

A82-10466 * # **Propfan installation aerodynamics of a supercritical swept wing transport configuration.** R. C. Smith and A. D. Levin (NASA, Ames Research Center, Moffett Field, CA). *AIAA, SAE, and ASME, Joint Propulsion Conference, 17th, Colorado Springs, CO, July 27-29, 1981, AIAA Paper 81-1563.* 14 p. 6 refs.

A semispan model with a powered propeller has been tested to provide data on the installation drag penalty of advanced propfan-powered transports designed to cruise at a Mach number of 0.8. These tests, conducted in 14-foot and 11-foot transonic wind tunnels, are a part of a NASA program to develop efficient, high-speed propellers for more fuel-efficient commercial transports for the 1990s and beyond. The model is instrumented for measuring propeller forces, wing/nacelle forces and moments, and pressure distributions over the wing and nacelle. The body in these tests was nonmetric, being connected to the wing by an RTV seal at the wing/body juncture. Tests were run at angles of attack from -3 to +5 deg over the Mach number range 0.6 to 0.85 at a Reynolds number of about 9,000,000. Results of these tests indicate that the nacelle interference drag can be quite large relative to an uninstalled nacelle. However, the losses due to the nacelle were reduced to acceptable levels by changes to the wing leading edge and nacelle intersection. The propeller slipstream causes substantial changes in the wing span load distribution indicating that twist modifications are needed to recover a more favorable span load distribution. (Author)

A82-10495 # **Characteristics and trends of energy consumption in transport missions with aircraft and surface vehicles (Caratteristiche e tendenze del consumo energetico nelle missioni di trasporto con aeroplani e con veicoli di superficie).** G. Gabrielli. *Ingegneria,* July-Aug. 1981, p. 193-198. 6 refs. In Italian.

A nondimensional factor is defined which characterizes energy consumption in transport missions. Values of this energy utilization factor are given for a number of aircraft and surface vehicles (e.g., automobiles, buses, and trains). Particular attention is given to the energy utilization factor of turbofan and turbojet aircraft. B.J.

A82-10496 # **The possibility of using deformable rubber components in landing gear (Possibilità di impiego di elementi deformabili in gomma in carrelli di atterraggio).** C. Caprile and L. Salvioni (Milano, Politecnico, Milan, Italy). *Ingegneria,* July-Aug. 1981, p. 201-212. In Italian.

A test program was devised to evaluate the use of precompressed rubber components as vibration dampers in landing gear for light aircraft. The test program is described, and dynamic and static test results are presented. A dissipationless model is developed which is shown to satisfactorily describe the behavior of the rubber components. B.J.

A82-10497 # **Problems relating to the classical rate-gyro (Problematiche relative al rate-gyro di tipo classico).** L. Borello (Torino, Politecnico, Turin, Italy). *Ingegneria,* July-Aug. 1981, p. 225-229. In Italian.

A mathematical model is developed for evaluating the accuracy of classical rate-gyros. An analysis is presented of the influence of secondary input signals associated with the angular velocity components of the platform. Ways to minimize the effects of these secondary signals are examined. B.J.

A82-10500 **Test Pilots' Aviation Safety Workshop, U.S. Naval Postgraduate School, Monterey, CA, February 25-28, 1981, Proceedings.** Workshop sponsored by the Society of Experimental Test Pilots and American Institute of Aeronautics and Astronautics. Edited by C. Tuomela (California Agricultural Aircraft Association, Sacramento, CA). New York, American Institute of Aeronautics and Astronautics, 1981. 100 p. Members, $12.50; nonmembers, $15.

Results are presented of discussions concerning existing and proposed training, equipment and methods for supplying the forecast demand for airline pilots for the period 1985-2000 from the cadre of general aviation. Areas covered include aeromedical education, training and equipment, the air traffic control system, the training and safety aspects associated with cockpit design analysis, pilot and maintenance personnel training accomplished by the fixed base operator, the effects of differences in flying qualities and performances between aircraft on safety and training effectiveness, pilot operating handbooks, regulatory aspects of pilot training and equipment, training and flight simulation programs for commercial pilots, and pilot weather knowledge. A.L.W.

A82-10545 **Implementation of AVRADCOM MM&T.** G. A. Gorline (U.S. Army, Aviation Research and Development Command, St. Louis, MO). *ManTech Journal,* vol. 6, no. 1, 1981, p. 3-6.

The general implementation plan of the Army Aviation Research and Development Command's (AVRADCOM) efforts in manufacturing methods and technology (MM&T) programs is described. A flowchart of the implementation procedure is presented, and attention is given to several examples of implementation, including a compressor casing, a titanium casting, and aluminum PM parts. B.J.

A82-10547 **Composite main rotor tubular braided.** M. White (Kaman Aerospace Corp., Bloomfield, CT). *ManTech Journal,* vol. 6, no. 1, 1981, p. 14-16. Army-supported research.

Mechanical tubular braiding has been demonstrated to be a viable blade spar manufacturing process after the completion of a program that included preliminary design of an improved main rotor blade for the OH-58 helicopter. The blade incorporates an advanced aerodynamic shape and has as its primary structural member a Kevlar 49/epoxy spar fabricated by braiding. The achievement of an analytically acceptable blade and spar design satisfying critical structural and dynamic requirements was not hindered by braiding process constraints. B.J.

A82-10646 **Navigation task partitioning in distributed-processing avionics systems.** J. L. Center (JAYCOR, Woburn, MA). *(Institute of Navigation, National Aerospace Meeting, Warminster, Pa., Apr. 8-10, 1981.) Navigation,* vol. 28, Summer 1981, p. 93-100. 10 refs. Contract No. N62269-80-C-0146.

An approach is presented for allocating navigation tasks among multiple processors prior to detailed design and implementation. The method is based on applying rate-distortion techniques from communication theory to navigation system design. All navigation activities are broken down into elementary functions, and rate-distortion methods are used to access the impact on rms position and velocity errors of limiting communication bandwidths among elementary functions. Groups of functions that require high-bandwidth communication are assigned to the same microprocessor, while those that can perform effectively with lower-bandwidth links are separated. The method is illustrated for aircraft motion and sensor errors in the north channel. J.F.

A82-10649 * **Improving the MLS through enhanced cockpit displays.** R. S. Jensen (Ohio State University, Columbus, OH). *(Institute of Navigation, National Aerospace Meeting, Warminster, Pa., Apr. 8-10, 1981.) Navigation,* vol. 28, Summer 1981, p. 138-146. 8 refs. NASA-sponsored research.

A simulator investigation of various prediction and quickening algorithms in computer-generated forward-looking displays is presented; the algorithms are used to improve manual aircraft control on curved microwave landing system approaches. The experimental facility consisted of a Link GAT-2 simulator, a PDP 11/40 minicomputer, a high-speed graphic display, a TV camera, and a CRT monitor. Results indicate that second- and third-order predictor displays provide the best lateral performance and that intermediate levels of prediction and quickening provide the best vertical control. Prediction/quickening algorithms of increasing computational order were found to significantly reduce aileron, rudder, and elevator control responses. The conventional crosspointer displays yielded an average 2-sigma lateral error of + or - 200 over all wind conditions at 500 m from touchdown, and was therefore unable to meet FAA requirements (+ or - 22.9 m); the pictorial-preview display yielded much better results: an average 2-sigma lateral error of + or - 27 m. Neither display was able to approach the FAA specified accuracy requirement in the vertical dimension (+ or - 3.7 m). J.F.

A82-10650 **Discrete address beacon, navigation and landing system.** R. P. Crow. *(Institute of Navigation, National Aerospace Meeting, Warminster, Pa., Apr. 8-10, 1981.) Navigation,* vol. 28, Summer 1981, p. 147-162.

The Discrete Address Beacon, Navigation and Landing System (DABNLS) is an integrated system which will provide not only air traffic control surveillance data and a two-way data link of the FAA's developmental Discrete Address Beacon System, but will provide precision area navigation and versatile landing guidance with a full Category IIIc capability. The DABNLS will utilize a single pair of L-band frequencies for the discretely addressed up-link interrogations and down-link replies. A ground facility will make precise azimuth and range measurements on the bi-phase coded reply pulses, as well as digitally process the reported altitude data to obtain the aircraft's latitude/longitude and other parameters. The data will be used for navigation, collision avoidance and ATC purposes. Multiple channels would be used in terminal areas, each having elevation facilities for landing guidance. Block diagrams of the DABNLS ground subsystem and air-borne transponders are given. J.F.

A82-10816 † **Optimization of the principal design parameters of a passenger aircraft (Optimizatsiia osnovnikh proektnikh parametriv pasazhirskogo litaka).** V. S. Mikalevich, G. M. Iun, and V. M. Kuz'menko. *Akademiia Nauk Ukrain'skoi RSR, Visnik,* vol. 45, Aug. 1981, p. 39-43. 7 refs. In Ukrainian.

A82-10321 # **Strong matching method for computing transonic viscous flows including wakes and separations - Lifting airfoils.** J. C. Le Balleur (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *La Recherche Aérospatiale* (English Edition), no. 3, 1981, p. 21-45. 46 refs. Research supported by the Direction des Recherches, Etudes et Techniques.

A method is presented for computing two-dimensional lifting steady viscous flows with wakes and possibly separations inside the viscous layer. A transonic potential calculation is used, which strongly interacts with a defect integral method. A mathematical model is also presented for matching the viscous model for averaged mean velocities with reverse flow, and for turbulent closure in nonequilibrium layers. Numerical coupling is reached through an iterative relaxation technique, and the wake geometry is calculated. The viscous mean flow is determined, and examples of applications to subsonic or supercritical airfoils are given. D.L.G.

A82-10822 # **Electrical ground testing of aircraft antistatic protection.** A. Bruere (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *La Recherche Aérospatiale* (English Edition), no. 3, 1981, p. 47-56. 5 refs.

After a review of the methods suggested to ensure aircraft protection regarding electrostatic spurious phenomena, one describes one of the two devices developed at ONERA for ground testing of this protection. These methods give the external surface of the aircraft a conductivity sufficient enough to enable on the one hand the measurement of the surface resistivity of the protected parts even if they are coated with a finishing layer of paint, and, on the other hand, to check the good electrical continuity of each structure element and the aircraft potential reference point. (Author)

A82-10851 **Fluid power technology for the '80s.** Warrendale, PA, Society of Automotive Engineers, Inc. (SAE Proceedings P-85), 1980. 38 p. $8.00.

Aspects of energy conservation with variable displacement pumps and motors are examined, taking into account approaches for hydraulic power generation, friction loads, elastic loads, regenerative braking, gravity loads, inertia loads, variable displacement pump characteristics, integrated actuator packages, a servopump analysis, a valve analysis, and the computation of pump and motor parameters. High-efficiency hydraulic power transfer units for multisystem aircraft are discussed along with basic approaches for reducing hydraulic system noise in aircraft. A description of developments in boundary layer thrust vector control is also provided. G.R.

A82-10853 **High-efficiency hydraulic power transfer units for multisystem aircraft.** W. E. Boehringer (Douglas Aircraft Co., Long Beach, CA). In: Fluid power technology for the '80s. Warrendale, PA, Society of Automotive Engineers, Inc., 1980, p. 15-20.

Multiple pumps are generally employed to provide fully powered aircraft flight controls with a redundant power source. The prime hydraulic source is, in most cases, a pump driven directly by one of the aircraft's engines. This approach provides the most efficient method of converting engine horsepower to hydraulic horsepower. The secondary hydraulic power source is generally not as efficient. Investigations were conducted with the objective to find sources of alternate hydraulic power with improved efficiency. The reasons for the inefficiency of current secondary hydraulic power sources were explored to obtain a basis for the design of systems with a better performance. A unit consisting basically of two hydraulic cylinders mounted back to back was designed and manufactured. The design of this unit was subsequently further improved. It is pointed out that the new hydraulic power transfer units obtained have a comparatively high running efficiency. G.R.

A82-10854 **'Quiet please'.** S. J. Skaistis (Sperry Corp., Sperry Vickers Div., Troy, MI). In: Fluid power technology for the '80s. Warrendale, PA, Society of Automotive Engineers, Inc., 1980, p. 21-26.

The considered investigation has the objective to indicate that noise control is the product of good engineering. It does not depend on learning a whole new discipline nor does it depend on invention. Because of the increasing use of hydraulics and the growth of noise sensitivity in aircraft, it was felt that aircraft hydraulic engineers should be aware of the desirability of noise control. A booklet was written for the general practitioner in aerospace hydraulics engineering. The first principle of quieting is that the most favorable cost-effectiveness ratio is achieved when noise control engineering is part of the original design effort. The second principle of quieting is that the loudest noise component must be reduced before appreciable quieting can be achieved. G.R.

A82-10855 **Developments in boundary layer Thrust Vector Control.** R. E. Fitzgerald and R. F. Kampe (Chandler Evans, Inc., West Hartford, CT). In: Fluid power technology for the '80s. Warrendale, PA, Society of Automotive Engineers, Inc., 1980, p. 27-35. 7 refs.

Thrust Vector Control (TVC) is commonly employed on a vehicle to provide larger magnitude steering forces during low velocity flight than can be obtained with aerodynamic fins. A method of thrust vectoring called boundary layer thrust vector control (BLTVC) is considered. BLTVC involves a variation of the secondary injection procedure. The limited deflection and flow ratio is amplified by means of an approach including an injection into a highly overexpanded nozzle. Deflections of 15 degrees are possible and ambient air is used as the injectant. Attention is given to the principles of BLTVC operation, a breakthrough in reducing nozzle size, and a scheme for producing roll control. Rocket applications of BLTVC cover a range in size from microthruster to remote piloted vehicle booster. BLTVC can be used on aircraft gas turbines also. Drawbacks of BLTVC are related to the necessity to employ very large nozzles for high-altitude applications. These drawbacks can be overcome with the aid of Confined Jet Thrust Vector Control. G.R.

A82-10889 # **A new APU for medium place aircraft environmental control systems.** C. Rodgers (Solar Turbines International, Turbomach Div., San Diego, CA). *American Society of Mechanical Engineers, Intersociety Conference on Environmental Systems, San Francisco, CA, July 13-15, 1981, Paper 81-ENAs-1.* 7 p. Members, $2.00; nonmember, $4.00.

New small auxiliary power units (APU) are sought to provide aircraft pneumatic power for environmental control and start systems. A new small gas turbine APU in the 20-50 hp class has been developed to meet the smaller aircraft secondary power requirements. The Gemini APU utilizes a single-stage radial compressor and a single-stage radial turbine wheel; it incorporates a single-can combustor with a unique spinning cup fuel atomizer. The electrical control provides for shutdown in case of malfunctions and also has an automatic bleed load control system. The load control valve permits greater operational flexibility by modulating flow to maintain rated turbine exhaust temperature under varying electrical loads. The engine is available in two configurations: one for combined bleed/shp applications and the other for shaftpower applications. Silent power versions of the Gemini military ground generator sets have been developed which produce an overall noise level as low as 60 dB, and fuel and oil requirements for the Gemini are compatible with those of most main propulsion gas turbines. Successful starting has been demonstrated by the APU from -65 F through 125 F, as well as through 2000 start-stop cycles. J.F.

A82-10890 # **Closed loop environmental control systems for fighter aircraft.** G. S. Tsujikawa and V. K. Rajpaul (Boeing Military Airplane Co., Seattle, WA). *American Society of Mechanical Engineers, Intersociety Conference on Environmental Systems, San Francisco, CA, July 13-15, 1981, Paper 81-ENAs-2.* 6 p. Members, $2.00; nonmembers, $4.00. USAF-sponsored research.

A favorable thermal environment for aircraft avionics implemented in an energy efficient manner is an important factor in reducing aircraft life cycle costs through improved avionic reliability. This paper discusses the application of closed loop environmental control systems (CECS) to a tactical mission aircraft. The specific objective was to determine CECS configurations which would provide significant savings in fuel consumption and life cycle costs while maintaining stable, low temperature, clean and dry environment for avionics equipment. Preliminary designs were developed for a positive displacement rotary vaned air cycle machine system, hybrid air/vapor cycle system, centrifugal Freon compressor vapor cycle system and a turbo-machinery air cycle machine system. System characteristics, details of design, performance and life cycle cost data were compared with an existing open loop air cycle system. The study showed that closed loop system configurations and close avionic temperature control resulted in substantial life cycle cost savings. (Author)

A82-10892 # **Towards minimum power for environmental control in transport aircraft.** D. Pierrepont (British Aerospace Public, Ltd., Co., Weybridge, Surrey, England). *American Society of Mechanical Engineers, Intersociety Conference on Environmental Systems, San Francisco, CA, July 13-15, 1981, Paper 81-ENAs-4.* 7 p. Members, $2.00; nonmembers, $4.00.

The minimization of the power consumed by the pneumatically powered environmental control system (ECS) on board transport aircraft, primarily the air conditioning system, is considered. It is noted that the development of a low-bleed ECS with subzero air cycle machine exit temperatures, condensing heat exchangers and recirculation leading to the doubling of the temperature difference between the fresh air supply and passenger and crew compartments has resulted in the halving of the fuel penalty associated with the ECS, (from 4% to 2%) while an additional halving of the penalty is possible by further reducing air flow or using a shaft-driven centrifugal compressor to provide the fresh air supply. Relative fuel savings to be had from air bleed reduction are shown to be significant with respect to those to be obtained in the areas of engines, aerodynamics and structures. The minimum fresh air flow required for the efficient operation of air supply systems within limits of passenger health and comfort is considered, and pneumatic and electrical means for the transmission of shaft power to the ECS are compared. The operating principles of air- and vapor-cycle cooling systems are then reviewed with respect to their performances, and advantages of the air cycle in the areas of complexity, maintenance and weight are noted. Consideration is also given to alternatives to bleed for anti-icing applications. A.L.W.

A82-10893 # **Design analysis of high temperature transparent windshields for high performance aircraft.** V. E. Wilson, A. J. Bockstahler (Rockwell International Corp., North American Aircraft Div., Los Angeles, CA), and C. A. Babish, III (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). *American Society of Mechanical Engineers, Intersociety Conference on Environmental Systems, San Francisco, CA, July 13-15, 1981, Paper 81-ENAs-5.* 11 p. 10 refs. Members, $2.00; nonmembers, $4.00. Contract No. F33615-68-C-3421.

Design criteria and analysis methods that are required to extend the thermal performance capabilities of lightweight, large field-of-view transparent windshield systems of Air Force aircraft into the Mach 2.5 to 3.5 speed regime are developed and demonstrated. Windshield system design requirements are established and designs are developed, analyzed, and revised in an iterative process until visual, structural, thermal, weight, and cost analyses show that the design requirements are satisfied. Design details on two windshield systems are presented. Because a successful windshield design for high speed aircraft depends, to a great extent, on the ability of the windshield to withstand the high temperatures associated with supersonic flight, the aerothermodynamic analysis method and results are emphasized. (Author)

A82-10894 # **Design challenges of high performance aircraft POD EOCM cooling systems.** R. D. Buckingham (Fairchild Industries, Inc., Fairchild Stratos Div., Manhattan Beach, CA). *American Society of Mechanical Engineers, Intersociety Conference on Environmental Systems, San Francisco, CA, July 13-15, 1981, Paper 81-ENAs-6.* 7 p. Members, $2.00; nonmembers, $4.00.

Modern high performance aircraft and associated Electro-Optical/Countermeasure (EOCM) pods have introduced very complex, high heat density electronics and avionics equipment, which requires mechanically refrigerated cooling to reject large amounts of heat from relatively small confined areas because of: insufficient/no cooling air from the host aircraft; miniaturization/high heat density of electronics; high temperature heat sink of high performance fighter-type aircraft, precluding ram air cooling; need for increased electronics/avionics reliability through lower operating temperature ranges. Electrically driven vapor compression systems are most effective for the EOCM-type pod missions, operating well at high and low altitudes, as well as at high and low flight speeds. Vapor cycle systems provide full ground cooling performance capability. (Author)

A82-10895 # **Air supply system bite for Boeing 767 airplane.** J. P. Patrick and G. F. Atkinson (United Technologies Corp., Hamilton Standard Div., Windsor Locks, CT). *American Society of Mechanical Engineers, Intersociety Conference on Environmental Systems, San Francisco, CA, July 13-15, 1981, Paper 81-ENAs-7.* 7 p. Members, $2.00; nonmembers, $4.00.

Modern airplane air supply systems regulate the temperature and pressure of engine bleed air extracted for cabin pressurization, air conditioning, anti-icing, cross-engine starting, air-driven hydraulic pumps and other pneumatic demands. The air supply system for the Boeing Model 767 airplane consists of a set of equipment for each of the airplane's two engines and a remotely located built-in-test-equipment (BITE) module. The air supply BITE system isolates over 95 percent of all failures to the line replaceable unit (LRU) level. The BITE system achieves this fault isolation via a modern digital electronic BITE module that continuously monitors inputs on a time-shared basis from dedicated BITE elements which are integrally contained in the air supply system LRUs. The operation of the all-pneumatic bleed air supply system is unaffected by the BITE system. Faults detected during bleed air system operation are stored in the BITE module nonvolatile memory for interrogation by the ground crew. Provisions are also made to allow BITE detected faults to be used as inputs to aircraft airborne integrated data systems (AIDS). (Author)

A82-10896 # **Air-film cooling returns to ramjets.** W. E. Roberts and S. Wasserberg (Marquardt Co., Van Nuys, CA). *American Society of Mechanical Engineers, Intersociety Conference on Environmental Systems, San Francisco, CA, July 13-15, 1981, Paper 81-ENAs-8.* 6 p. Members, $2.00; nonmembers, $4.00.

A ramjet engine was configured for the Navy Firebrand program to propel an antiship target missile. After years of using insulation to thermally protect engine combustor/nozzle assemblies, air-film cooling was used in the Firebrand engine. A combustor liner causes a layer of cool air to be injected between the combustion gas and combustor/nozzle structural shell. As this film flows downstream, mixing and reaction with combustion gas causes its cooling effectiveness to deteriorate. A satisfactory structural design requires shell temperature prediction. Using three film cooling correlations, a method of defining the Firebrand film cooling effectiveness is shown. Thermal models are presented which utilize this effectiveness and provide shell temperature predictions under ground test conditions. This analytical method is shown to be sufficient when predicted temperatures are compared with shell temperatures measured during these ground tests. (Author)

A82-10901 # **In-situ calibration of flight heat transfer instrumentation.** H. W. Kipp and E. A. Elswirth (McDonnell Douglas

Astronautics Co., St. Louis, MO). *American Society of Mechanical Engineers, Intersociety Conference on Environmental Systems, San Francisco, CA, July 13-15, 1981, Paper 81-ENAs-13.* 5 p. 8 refs. Members, $2.00; nonmembers, $4.00.

In-situ calibration offers a promising approach for economically minimizing errors in surface heating rates obtained from subsurface, transient, temperature measurements. Experience has shown that surface heat flux solutions are sensitive to inaccuracies in variables such as thermocouple location, temperature measurements, model thermal properties and joint conductances. It is the purpose of in-situ calibration to determine the values of finite difference thermal model parameters which result in the least square error solution. A calibration heat flux is imposed on the surface surrounding a thermocouple installation and the thermal response is recorded. The temperature history is used in an inverse solution to obtain the surface heat flux which is then compared with the calibration pulse. Repetitive values of surface heat flux are obtained by systematically varying model parameters until the calculated and calibration fluxes agree within a prescribed tolerance. The concept is illustrated with a numerical example. (Author)

A82-10920 # **Air-freon integrated environmental conditioning system for trainer subsonic aircraft.** M. Andriano, A. Mannini, and V. Marchis (Microtecnica-Torino, Turin, Italy). *American Society of Mechanical Engineers, Intersociety Conference on Environmental Systems, San Francisco, CA, July 13-15, 1981, Paper 81-ENAs-33.* 7 p. Members, $2.00; nonmembers, $4.00.

Development studies of a cabin environmental control system (ECS) for a new trainer subsonic aircraft are presented. The new vapor cycle cooling system is energy efficient for engines sensitive to bleed air extraction. The hybrid air-freon ECS is composed of four subsystems: the recirculation loop, the bleed air line, the ram air line, and the supplementary cooling assembly (SCA). The air system emergency control law and the SCA system emergency control law are shown schematically in flow charts: if the sensor in the recirculating loop duct measures a temperature higher than 100 C, the bypass valve is immediately closed; it is only opened if the duct temperature decreases below 70 C. The compressor in the SCA system is switched off in cases where the pressure is above 2.5 MPa and lower than 0.3 MPa. Performance tests correlated well with predicted ones, and the system overall weight was optimized at 30 kg. The ECS was compared with the bootstrap air system and found to have a substantially better bleed air flow rate (ECS = 1.70 kg/min; bootstrap = 7.0 kg/min). J.F.

A82-10934 * # **Multiple-scale turbulence modeling of free turbulent flows.** G. Fabris and P. T. Harsha (Science Applications, Inc., Combustion Dynamics and Propulsion Technology Div., Canoga Park, CA). *American Society of Mechanical Engineers and American Society of Civil Engineers, Joint Applied Mechanics, Fluids Engineering, and Bioengineering Conference, University of Colorado, Boulder, CO, June 22-27, 1981, ASME Paper 81-FE-20.* 11 p. 28 refs. Members, $2.00; nonmembers, $4.00. Contract No. NAS1-15988.

As part of an investigation into the application of turbulence models to the computation of flows in advanced scramjet combustors, the multiple-scale turbulence model has been applied to a variety of flowfield predictions. The model appears to have a potential for improved predictions in a variety of areas relevant to combustor problems. This potential exists because of the partition of the turbulence energy spectrum that is the major feature of the model and which allows the turbulence energy dissipation rate to be out of phase with turbulent energy production. To establish the general reliability of the approach, it has been tested through comparison of predictions with experimental data. An appreciable overall improvement in the generality of the predictions is observed, as compared to those of the basic two-equation turbulence model. A Mach number-related correction is found to be necessary to satisfactorily predict the spreading rate of the supersonic jet and mixing layer. (Author)

A82-10952 * # **Thermal and flow analysis of a convection, air-cooled ceramic coated porous metal concept for turbine vanes.** F. S. Stepka (NASA, Lewis Research Center, Cleveland, OH). *American Society of Mechanical Engineers and American Institute of Chemical Engineers, National Heat Transfer Conference, 20th, Milwaukee, WI, Aug. 2-5, 1981, ASME Paper 81-HT-48.* 7 p. 9 refs. Members, $2.00; nonmembers, $4.00.

Analysis was made of the heat transfer and pressure drop through turbine vanes made of a sintered, porous metal coated with a thin layer of ceramic and convection cooled by spanwise flow of cooling air. The analysis was made to determine the feasibility of using this concept for cooling very small turbines, primarily for short duration applications such as in missile engines. The analysis was made for gas conditions of approximately 10 and 40 atm and 1644 K and with turbine vanes made of felt-type porous metals with relative densities from 0.2 and 0.6 and ceramic coating thicknesses of 0.076 to 0.254 mm. (Author)

A82-10965 # **Fuel for future transport aircraft.** G. D. Brewer (Lockheed-California Co., Burbank, CA). *American Society of Mechanical Engineers and American Institute of Chemical Engineers, National Heat Transfer Conference, 20th, Milwaukee, WI, Aug. 2-5, 1981, ASME Paper 81-HT-80.* 8 p. 6 refs. Members, $2.00; nonmembers, $4.00.

Despite attempts at conservation and the development of synthetic aviation-grade kerosene from alternative fossil fuel materials, it is widely recognized that alternatives to conventional petroleum-base aircraft fuels must become available in the near future. The present paper discusses the prospects for liquid hydrogen as a future fuel for transport aircraft. Advantages of liquid hydrogen over synthetic fuels and liquid methane as alternative fuels in the areas of availability, safety, pollution, relative energy efficiency as a function of trip length and aircraft weight, overall costs and airport compatibility are considered. The possible requirements for a development program aimed at preparing liquid hydrogen for use in operational aircraft are examined, and the probable time characteristics of fuel use during the transition to liquid hydrogen, which may significantly replace synthetic fuels by the year 2000, are considered. A comprehensive plan for liquid hydrogen fuels R&D is then presented which is currently being considered for implementation on an international basis. A.L.W.

A82-10986 # **Control laws for adaptive wind tunnels.** E. H. Dowell (Princeton University, Princeton, NJ). *AIAA Journal,* vol. 19, Nov. 1981, p. 1486-1488. 5 refs. Research supported by Princeton University.

A control law is developed which will permit the systematic modification of wind tunnel wall conditions, in order to minimize the interference about a model. The approach is valid for both three-dimensional and lifting flows and, subject to the assumption of linearity, is not dependent on any particular theoretical description of the fluid. In addition, unlike previous control schemes, the present method does not require an iterative approach. O.C.

A82-10987 # **Wind tunnel tests on airfoils in tandem cascade.** S. Raghunathan (Belfast, Queen's University, Belfast, Northern Ireland), C. P. Tan, and N. A. J. Wells. *AIAA Journal,* vol. 19, Nov. 1981, p.1490-1492.

Wind tunnel tests on airfoils in tandem cascade, of the type found on the Wells-type turbine, were conducted in a low-speed tunnel with a maximum air velocity of 35 m/sec. Airfoils tested had a chord of 85 mm and a span of 100 mm and included the NACA 0012, 0018 and 0021 profiles. The freestream dynamic pressure was measured upstream of the cascade by a Pitot tube, as well as the tangential and normal forces on the blades. Tests were performed for several cascade solidities and at angles of incidence varying from zero to 90 deg, with Reynolds numbers of about 100,000. O.C.

A82-11020 **Tangential sensitivity of EW receivers.** J. Tsui (USAF, Avionics Laboratory, Wright-Patterson AFB, OH). *Microwave Journal,* vol. 24, Oct. 1981, p. 99-102. 8 refs.

A systematic approach to the determination of the tangential sensitivity of a receiver is presented, and calculated results are compared with experimental data. Particular consideration is given to the following topics: the practical determination of the effective noise bandwidth to be used in the sensitivity calculations of an EW receiver; the influence of the RF gain in the receiver on the sensitivity; and the influence of the RF bandwidth and the video bandwidth on the sensitivity. B.J.

A82-11031 **Relationships between naval aviation safety and pilot flight experience.** M. S. Borowsky (U.S. Naval Safety

Center, Norfolk, VA). *Aviation, Space, and Environmental Medicine,* vol. 52, Oct. 1981, p. 608-610.

Flight activity of all aviators flying naval aircraft and aircraft accident data were analyzed to determine if statistical relationships among lifetime and recent experience variables and accident liability exist. The results demonstrate that accident potential, though not statistically related to flight hours in 30-d periods, is correlated with lifetime flight experience with the higher liability associated with minimal amounts of flight hours and with transitioning into new aircraft. (Author)

A82-11149 **Acoustic emission - An emerging technology for assessing fatigue damage in aircraft structure.** C. D. Bailey and W. M. Pless (Lockheed-Georgia Co., Marietta, GA). *Materials Evaluation,* vol. 39, Oct. 1981, p. 1045-1050. 12 refs.

Guidelines for the design of a dedicated acoustic emission (AE) system for aircraft fleet installations are discussed. It is shown that the successful development of an on-board AE crack detection system depends on the existence of an integrated body of technology combining AE detection technology, structural and crack growth characteristics, noise and EMI discrimination or rejection, and fleet maintenance practices. These technologies must be fully integrated through the development and deployment of the system to achieve cost-effective results. V.L.

A82-11177 * **Rheological behavior of progressively shear-thickening solutions.** S. T. J. Peng and R. F. Landel (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA). *Journal of Applied Physics,* vol. 52, Oct. 1981, p. 5988-5993. 13 refs. Contract No. NAS7-100.

The rheological behavior of the recently developed polymer FM-9 in Jet A fuel and JP 8 fuel is reported. In aqueous solution, FM 9 is found to exhibit strong time-dependent shear thickening behavior. Induction time necessary for the onset of thickening is found to depend on shear rate, solvent, concentration, and molecular weight. Altering the nature of the solvent results in effects similar to those obtained by changing the concentration or molecular weight. A critical shear rate is derived, and is inversely proportional to the zero shear rate viscosity of the solution for the temperature and concentrations observed. The onset of shear thickening behavior appears to be related to the onset of viscoelastic response, and thus the time scale follows reduced variable behavior. D.L.G.

A82-11222 **Development of the Triflex rotor head.** A. Cassier (Société Nationale Industrielle Aérospatiale, Marignane, Bouches-du-Rhône, France). *American Helicopter Society, Journal,* vol. 26, July 1981, p. 25-31.

This paper reviews the development of a new hingeless rotor hub named Triflex. This hub is made of composite materials and features flexible arms that provide blade retention, flap/lag/pitch degrees of freedom through structural deflection, and lag damping. A large part of the Triflex hub design effort has been devoted to determination of the flexible arm characteristics, since these strongly affect the behavior of the rotor in flight. The Triflex hub dynamic characteristics were carefully checked during laboratory and whirl stand tests and found to be in agreement with theoretical predictions. Flight tests of the Triflex rotor on a Gazelle helicopter were successful in demonstrating the feasibility of the concept. Though rotor lag damping was found to be weak, no insurmountable stability problems were encountered, and the flying qualities of the Gazelle helicopter fitted with the Triflex hub were good. The next phase of the Triflex hub development will be aimed at improving the hub's structural damping characteristics and at optimizing the manufacturing process. (Author)

A82-11224 **Fatigue substantiation of non-linear structures.** B. P. W. Stocker (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). *(American Helicopter Society, Midwest Region Helicopter Fatigue Methodology Specialists Meeting, St. Louis, MO, Mar. 1980.) American Helicopter Society, Journal,* vol. 26, July 1981, p. 51-55.

Structures such as preloaded joints and lugs frequently exhibit non-linear load/stress relationships at critical locations. This paper presents some examples of such structures, including typical attachment lugs and preloaded threaded attachments, to illustrate the importance of test load level selection and determination of load vs stress relationships at fracture origins. The possibility that accelerated fatigue testing may sometime fail to reveal critical design weaknesses or result in unrepresentative modes of fracture is explored, and simple ways of avoiding this problem are discussed. (Author)

A82-11225 **On computing Floquet transition matrices of rotorcraft.** G. H. Gaonkar, D. Sastry (Indian Institute of Science, Bangalore, India), and D. S. S. Prasad (National Aeronautical Laboratory, Bangalore, India). *American Helicopter Society, Journal,* vol. 26, July 1981, p. 56-61. 23 refs.

There are conflicting claims concerning the efficiency of different schemes of computing the Floquet transition matrices of rotorcraft. In this paper, computer-generated data are presented on the comparative efficiency of four classes of methods: (1) Runge-Kutta one-step; (2) Hamming's predictor-corrector multistep; (3) Bulirsch-Stoer extrapolation; and (4) hybrid or variable order. Data pertain to single-pass and N-pass schemes for four flap-lag stability models. It is found that Hamming's fourth-order predictor-corrector method in single pass is the most economical with respect to three-significant-figure accuracy. The analytical formulation confirms the advantage of the single-pass approach over the N-pass, provides useful approximations to machine-time data, and is a feasible economical approach to comparing different methods with respect to machine time. B.J.

A82-11300 **Model helicopter rotor impulsive noise.** J. E. Hubbard, Jr. and W. L. Harris (MIT, Cambridge, MA). *Journal of Sound and Vibration,* vol. 78, Oct. 8, 1981, p. 425-437. 18 refs. Contract No. DAAG29-C-027.

An investigation of helicopter rotor blade slap was performed on a 1.27 m diameter model rotor. The rotor blades were a NACA 0012 section with a -8 deg linear twist. The experiments were conducted in the MIT Anechoic Wind Tunnel. The effects of number of blades, blade pitch, advance ratio, and shaft angle on the generation and intensity of blade slap have been investigated. The effect of each parameter was determined by varying the parameter of interest while keeping the others constant. The rotor tip speeds of the tests performed in this study were limited to approximately Mach 0.4. The directivity associated with the blade slap signature was measured. The results of this investigation are based on a subjective definition of blade slap. (Author)

A82-11302 # **Ideal and simulated performance of an aircraft in the terrain following mission.** U. R. Prasad (Indian Institute of Science, Bangalore, India) and B. S. Subrahmanyam. *Aeronautical Society of India, Journal,* vol. 31, Feb.-Nov. 1979, p. 13-19. 6 refs.

A new synthesis method of terrain following system design to realize closely the ideal performance obtainable from an aircraft in the mission is presented. Ideal performance analysis and division of the mission into Avoid and Follow modes of flight leads to natural template constructions imbedding the aircraft climb performance and human pilot tolerance limits to accelerations. Simulation of aircraft flight in the mission complements the analysis in fixing the configuration and parameters of the system. Step terrains are used in the design iterations of the system because of their worst-case character. (Author)

A82-11314 # **Dynamic response of aircraft structure to gun shock loads.** P. N. Raju and V. P. Rangaiah (Hindustan Aeronautics, Ltd., Bangalore, India). *Aeronautical Society of India, Journal,* vol. 31, Feb.-Nov. 1979, p. 103-105. 5 refs.

The dynamic response of a fighter aircraft to gun firing is assessed, the vibration levels on the airframe being measured by flight tests of the aircraft in the development phase. The aircraft is instrumented for measuring the vibration levels at various points on the aircraft structure, for example, the wing tip, fuselage, tail plane, and aileron and elevator. The flight vibration data thus obtained is analyzed using standard methods available in the literature. The analyzed data is plotted to ascertain whether the vibration levels fall below the upper bounds of the envelope drawn from the previous flight-test data for the aircraft of the same class. C.R.

A82-11317 # **Development of aircraft production engineering discipline at IIT, Bombay.** N. K. Naik (Indian Institute of Technology, Bombay, India). *Aeronautical Society of India, Journal,* vol. 31, Feb.-Nov. 1979, p. 119-125.

The aircraft production engineering courses offered at the Indian Institute of Technology, in Bombay, are discussed. To demonstrate the value of the courses, the fundamentals of aircraft production are outlined, the discussion being confined to airframe production. The loft-template method is described, and the principal loft-template scheme used in aircraft production is shown. Also described are the theory and laboratory courses offered at the institute. C.R.

A82-11359 **Nonlinear prediction of subsonic aerodynamic loads on wings and bodies at high angles of attack.** P. Zhu, W. Shou (China Aeronautical Establishment, Institute of Computing Technology, Xi'an, Shaanxi, People's Republic of China), and S. Luo (Northwestern Polytechnical University, Xi'an, Shaanxi, People's Republic of China). *Computer Methods in Applied Mechanics and Engineering*, vol. 26, June 1981, p. 305-319. 6 refs.

This paper predicts numerically the nonlinear aerodynamic loads on wings and bodies at high angles of attack in subsonic flow separating along certain known lines. It is assumed that the separation vortices are symmetric and unbursting. The wing mean surfaces and body surfaces are simulated by bound vortex lattices, and the separation vortex surfaces by free vortex lines. The vortex system satisfies boundary conditions on wing and body surfaces, separation conditions, and the condition that free vortex lines are tangent to local velocity. The velocity induced by a vortex is computed by the Biot-Savart law with Göthert transformation for subsonic small perturbation flows. The vortex strengths and the free vortex locations are solved by relaxation method. Then the aerodynamic loads on wings and bodies are computed. They agree well with experimental tests. (Author)

A82-11400 **A note on fatal aircraft accidents involving metal fatigue.** G. S. Campbell (National Aeronautical Establishment, Ottawa, Canada). *International Journal of Fatigue*, vol. 3, Oct. 1981, p. 181-185. 6 refs.

A world-wide survey of aircraft accidents was taken to determine the extent to which metal fatigue is responsible for the incidents. A total of 306 fatal accidents since 1934 were found to be either wholly or partially due to metal fatigue; these accidents resulted in 1803 deaths. Two-thirds of the accidents involved fixed-wing iarcraft, with wing failure (88 accidents) being the most common cause, followed by engine failure (56 accidents). Of the 90 fatal helicopter accidents, about a third were due to failure of the main-rotor system, and a quarter were due to tail-rotor failure. Over the last four years there has been an average of 18 fatal accidents per year resulting from metal fatigue; about 11 have been for fixed-wing aircraft and seven have been for helicopters. Thirteen accidents were attributed to a failure to increase the inspection frequency required for aircraft used in a role for which they were not originally designed. J.F.

A82-11406 **A mathematical model of an over-sea airborne UHF radio link.** T. Slator. *Marconi Review*, vol. 44, 2nd Quarter, 1981, p. 101-118. 9 refs.

A mathematical model is described which enables the performance of an over-the-sea airborne UHF radio link to be estimated as a function of terminal height and separation distance taking account statistically of variations of signal level caused by such factors as irregular antenna radiation patterns and a rough sea surface. (Author)

A82-11407 **Optical sensors for displacement measurement.** S. M. McGlade. *Marconi Review*, vol. 44, 2nd Quarter, 1981, p. 119-136. 7 refs.

A measurement system consists of sensors which are connected to a control center. The use of fiber optics as the communications link has a number of advantages. Two of the most important are immunity from electromagnetic interference and the elimination of the danger of electrical sparking in explosive environments. These advantages are reduced by the necessity to use electrical devices in the sensors. If the sensors were wholly optical then the advantages of fiber optics would apply to the entire system outside the control center. Optical sensors will be difficult to develop. Initially, at least, they are only justified in applications where such methods are becoming essential. One such area is in military aircraft. An optical displacement transducer can be obtained by using the displacement to alter the transmission aperture of a light beam. Attention is also given to strain measurement using two beam interferometry, Fabry-Pérot interferometry displacement measurement, and strain induced birefringence. G.R.

A82-11434 **End losses in turbine cascades with porous cooling.** V. M. Epifanov and V. I. Gus'kov. *(Aviatsionnaia Tekhnika*, no. 3, 1980, p. 46-49.) *Soviet Aeronautics*, vol. 23, no. 3, 1980, p. 38-41. 7 refs. Translation.

Experimental results on porous-cooled turbine blades are presented and discussed. Exit losses in the blades are found to depend on coolant flowrate and the degree of roughness of the porous surface. B.J.

A82-11444 **Study of reingestion of exhaust gases with different initial temperature in a reversed turbojet engine.** Z. V. Akhtiamov and M. Sh. Giliazov. *(Aviatsionnaia Tekhnika*, no. 3, 1980, p. 101-103.) *Soviet Aeronautics*, vol. 23, no. 3, 1980, p. 87-89. Translation.

A82-11446 **Results of experimental study of heat transfer to turbine blades with porous cooling.** S. G. Dezider'ev, A. G. Karimova, and V. I. Lokai. *(Aviatsionnaia Tekhnika*, no. 3, 1980, p. 109-112.) *Soviet Aeronautics*, vol. 23, no. 3, 1980, p. 97-99. 8 refs. Translation.

A82-11448 **One reason for the onset of high-frequency self-excited oscillations.** V. P. Pavlovskii. *(Aviatsionnaia Tekhnika*, no. 3, 1980, p. 116-118.) *Soviet Aeronautics*, vol. 23, no. 3, 1980, p. 104-106. 5 refs. Translation.

Experiments have been carried out to investigate generation mechanisms of high-frequency auto-oscillations resulting from an increase in the pressure differential across the combustion chamber injectors of a flight vehicle engine. It is found that a possible reason for the onset of the high-frequency auto-oscillations is breakdown of the annular gas cavity in the oxidizer injector nozzle which initiates unstable combustion due to the vapor phase removal. V.L.

A82-11459 **Calculation of aerodynamic characteristics of jet flapped airplane.** V. G. Akent'ev and V. V. Guliaev. *(Aviatsionnaia Tekhnika*, no. 4, 1980, p. 3-6.) *Soviet Aeronautics*, vol. 23, no. 4, 1980, p. 1-4. Translation.

A numerical method is developed for calculating the steady-state aerodynamic characteristics of an aircraft with jet flaps. The flow past the aircraft and the jet are modeled as a system of oblique horseshoe-shaped vortices, and the problem is solved in the linear formulation for an incompressible medium. B.J.

A82-11462 **On low-speed wind tunnels with deformable boundaries.** A. A. Gruzdev. *(Aviatsionnaia Tekhnika*, no. 4, 1980, p. 23-26.) *Soviet Aeronautics*, vol. 23, no. 4, 1980, p. 18-20. 7 refs. Translation.

Attention is given to the development of self-streamlining or self-correcting wind tunnels. Linear theory under the assumption of potential flow is used to study the shape of streamline surfaces near a wing of finite aspect ratio moving near a screen. The characteristics of flow macrostructure in the wake are analyzed; and it is shown that, in contrast to the case of two-dimensional flow, it is not possible to streamline the walls of the tunnel in the absence of a vortex wake in the case of three-dimensional flow. B.J.

A82-11463 **Basic problem of aircraft gasturbine engine analytic design. II.** Iu. V. Kozhevnikov, V. O. Borovik, V. S. Ivanov, V. A. Talyzin, I. N. Agliullin, and Iu. V. Meluzov. *(Aviatsionnaia Tekhnika*, no. 4, 1980, p. 27-32.) *Soviet Aeronautics*, vol. 23, no. 4, 1980, p. 21-24. Translation.

The paper presents results of the analytical optimization of the basic thermogasdynamic parameters of the cycle and the characteristic areas of the air path of a turbojet bypass engine; the optimization criterion is minimum engine-mass and minimum fuel required for a given flight distance. The multimode character of engine operation is analyzed. B.J.

A82-11464 **Formation of triangular-element stiffness matrix using sliding interpolation.** P. D. Levashov. *(Aviatsionnaia Tekhnika*, no. 4, 1980, p. 33-37.) *Soviet Aeronautics*, vol. 23, no. 4, 1980, p. 25-28. Translation.

The paper examines the use of sliding interpolation to construct the stiffness matrix of triangular elements of flat rib-stiffened panels. This approach makes it possible to raise the order of the displacement field by employing computational parameters from adjacent elements without increasing the total number of unknowns. A computational example is discussed. B.J.

A82-11465 **On evaluating the influence of local disruptions of flow over trailing edge and leading edge flaps from the data of wind tunnel tests of a rectangular wing segment.** A. I. Matiazh, V. A. Sterlin, A. B. Kuznetsov, V. V. Isaev, A. A. Shapiro, and E. M. Ksenofontova. *(Aviatsionnaia Tekhnika,* no. 4, 1980, p. 38-42.) *Soviet Aeronautics,* vol. 23, no. 4, 1980, p. 29-32. 5 refs. Translation.

Equipment for the suspension and control of leading and trailing flaps was tested in a low-speed wind tunnel. The influence of the control mechanisms, and, of their positions along the wing span and in the cross section, on the integral aerodynamic characteristics of a rectangular wing was evaluated. It is found that local disturbances of flow past leading and trailing flaps produce a significant reduction of lift and an increase of drag. B.J.

A82-11468 **On the use of carbon composites in slat and stabilizer construction.** B. N. Kornev, R. I. Guseva, and V. A. Tikhomirov. *(Aviatsionnaia Tekhnika,* no. 4, 1980, p. 72-74.) *Soviet Aeronautics,* vol. 23, no. 4, 1980, p. 59, 60. Translation.

Glass-graphite-plastic composite materials were used in the construction of aircraft deflectors and stabilizers. This paper reviews the details of construction, and examines static-load testing results for both deflector and stabilizer. B.J.

A82-11469 **Synthesis of system for evaluating gyrostabilizer state with unknown disturbances.** A. A. Leporskii. *(Aviatsionnaia Tekhnika,* no. 4, 1980, p. 74-76.) *Soviet Aeronautics,* vol. 23, no. 4, 1980, p. 61-63. Translation.

A82-11470 **On the question of trailing airplane motion.** A. A. Novad. *(Aviatsionnaia Tekhnika,* no. 4, 1980, p. 79-81.) *Soviet Aeronautics,* vol. 23, no. 4, 1980, p. 67, 68. Translation.

Equations are derived for the three-dimensional motion of an aircraft and are solved analytically for the initiation of banking flight. The solution describes the effect of the specific wing load on the normal acceleration overloading of the aircraft. It is noted that the danger of a spin increases with increasing specific load. B.J.

A82-11471 **Experimental study of empennage snap-through vibrations.** V. A. Pavlov, F. Sh. Khakimullin, A. Ia. Gur'ianov, and M. I. Gershtein. *(Aviatsionnaia Tekhnika,* no. 4, 1980, p. 81-84.) *Soviet Aeronautics,* vol. 23, no. 4, 1980, p. 69-71. 5 refs. Translation.

The snap-through oscillations of a rectangular-planform empennage model were studied in a subsonic wind tunnel. The aim of the study was to isolate the snap-through oscillations from all other possible oscillations in the flow. An analysis of changes of the normal and frontal curvatures of the control surface demonstrate the occurrence of snap-through oscillations. The frontal curvature falls to practically zero in the case of static snap-through. B.J.

A82-11686 **Fatigue life of lugs under service loading - Test results and predictions.** A. Buch and A. Berkovits (Technion - Israel Institute of Technology, Haifa, Israel). *Materialprüfung,* vol. 23, Oct. 1981, p. 344-348. 27 refs.

Aircraft pin-lug joints with and without interference fit were tested in maneuver loading programs with random loading sequence in order to investigate the effect of design load, lug material and interference fit on the spectrum fatigue life. An interference fit of 0.3% had a strong beneficial effect on the fatigue life for all loading programs, even when local tensile stress peaks exceeded the material yield stress. The spectrum fatigue life of 2024-T351 lug specimens was longer than that of 7075-T7351 specimens, except under the most severe loading program. Test results were compared with predictions based on the Miner's rule, the relative Miner rule, and the Neuber-Topper notch analysis method. The relative Miner rule was superior to the conventional rule in predicting the spectrum fatigue life of aircraft lugs; the Neuber-Topper notch analysis method was shown to have some application for the prediction of the effect of design load on the fatigue life of lugs with interference fit, but for the case of lugs without interference fit, predicted and test results disagreed completely. The disagreement is explained by the effect of fretting. J.F.

A82-11715 # **New separators for battery systems.** J. Lee and V. D'Agostino (RAI Research Corp., Hauppauge, NY). In: Intersociety Energy Conversion Engineering Conference, 16th, Atlanta, GA, August 9-14, 1981, Proceedings. Volume 1 New York, American Society of Mechanical Engineers, 1981, p. 111-116.

The reported study takes into consideration separators for miniature cells, such as silver/zinc button cells, and separators for aircraft nickel/cadmium batteries. It is pointed out that separators for energy systems having an aqueous electrolyte, either acid or basic, can be prepared by selective modification of radiation grafting parameters. A new family of separators, known as the 'SC' series, has been developed. The SC separators have very uniform electrolytic resistance, excellent mechanical strength, and lower cost. General improvements in battery service life could be observed as a result of the introduction of the grafted separators. The cycle life of vented aircraft Ni/Cd batteries could be extended three to four times. G.R.

A82-11716 # **Sealed lead-acid batteries for aircraft applications.** K. L. Senderak and A. W. Goodman (U.S. Navy, Naval Weapons Support Center, Crane, IN). In: Intersociety Energy Conversion Engineering Conference, 16th, Atlanta, GA, August 9-14, 1981, Proceedings. Volume 1. New York, American Society of Mechanical Engineers, 1981, p. 117-122.

In the 1970's, an important advance in lead-acid battery technology occurred with the introduction of sealed, no-maintenance, lead-acid batteries. A description is given of a wide variety of studies and tests conducted to evaluate the suitability of the new batteries for employment in Navy aircraft. The results show that the sealed lead-acid (SLA) cells can be successfully used in a potentially large number of aircraft applications, where very high-rate discharge performance is not required. The Navy is actively pursuing the SLA battery for these applications to substantially reduce the Navy's overall battery procurement and maintenance costs, and to improve reliability. G.R.

A82-11717 # **Applications of finite element method in aerospace power systems design.** E. U. A. Siddiqui. In: Intersociety Energy Conversion Engineering Conference, 16th, Atlanta, GA, August 9-14, 1981, Proceedings. Volume 1. New York, American Society of Mechanical Engineers, 1981, p. 123-126.

Complex power systems are needed to satisfy the exacting power requirements of current avionic systems. A suitable tool for the design of such power systems is finite element analysis, based on the principle of minimization of total potential energy. This technique is being successfully used to eliminate excess weight and to accurately predict stresses and resonant frequencies. The new method was used to conduct an analysis in connection with a problem related to the occurrence of severe vibrations in a 30,000 rpm generator. The analysis had the objective to determine the effects of modifications made to the generator frame. It was found that the resonant frequency could be raised above the operational speed of the generator by introducing suitable modifications to the design of the frame. G.R.

A82-11718 # **Advanced aircraft electric power system.** J. D. Segrest (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). In: Intersociety Energy Conversion Engineering Conference, 16th, Atlanta, GA, August 9-14, 1981, Proceedings. Volume 1. New York, American Society of Mechanical Engineers, 1981, p. 127-129.

The Advanced Aircraft Electric Power System is to increase fuel efficiency and reduce life cycle costs. The system includes 270 volt DC generators, solid state regulation, flat bus distribution, solid state switching, digital multiplex control and protection of power distribution through a system algorithm, and switching regulator power conditioning. A description is presented of the system concept, the hardware development, and the status of the Navy program. A high voltage DC power system development had been initiated by the Navy to exploit the advantages of high-voltage DC operation for future aircraft. G.R.

A82-11719 # **Variable speed constant frequency /VSCF/ electrical system cuts cost of ownership.** R. V. Hildebrant and R. C. VanNocker (General Electric Co., Aircraft Equipment Div., Binghamton, NY). In: Intersociety Energy Conversion Engineering Conference, 16th, Atlanta, GA, August 9-14, 1981, Proceedings. Volume 1. New York, American Society of Mechanical Engineers, 1981, p. 130-135. 5 refs.

The methodology employed in the development of the electrical generating system for the F/A-18 aircraft is considered. This system was the first production application in which the cycloconverter electronics were packaged with the generator and mounted directly to the accessory gearbox. Being the first production system of this type, a detailed and comprehensive analysis and evaluation program was undertaken to provide assurance that the design could operate with a high degree of reliability in this generally hostile environment. A primary maintainability design objective was related to the design and the selection of parts and materials which would last for the life of the unit without scheduled maintenance. Attention is given to maintenance cost experience and life cycle costs. G.R.

A82-11720 # **A hidden advantage of permanent magnet electrical generating systems.** J. J. O'Neill (General Electric Co., Binghamton, NY). In: Intersociety Energy Conversion Engineering Conference, 16th, Atlanta, GA, August 9-14, 1981, Proceedings. Volume 1. New York, American Society of Mechanical Engineers, 1981, p. 136-139. 7 refs. USAF-supported research.

The development of permanent magnet aircraft electrical generating systems heralds the beginning of a new era. This technique brings many advantages to the user in terms of size, weight and reliability. However, the most significant of these advantages is the extremely high efficiency which is characteristic of these systems. This paper examines the effect of the higher system efficiency on the user, specifically in the area of aircraft fuel consumption. Driven by rising fuel costs, engine and aircraft manufacturers are striving for more efficient performance to minimize life cycle costs. The results of a study which examines the effect of several permanent magnet ratings on different aircraft sizes are presented. (Author)

A82-11721 # **60 KVA ADP permanent magnet VSCF starter generator system - Generator system performance characteristics.** R. C. Webb (General Electric Co., Binghamton, NY). In: Intersociety Energy Conversion Engineering Conference, 16th, Atlanta, GA, August 9-14, 1981, Proceedings. Volume 1. New York, American Society of Mechanical Engineers, 1981, p. 140-145. Contracts No. F33615-78-C-2200; No. F33615-74-C-2037.

A description is presented of a Variable Speed Constant Frequency (VSCF) system, which consists of a cycloconverter with a synchronous generator that uses samarium cobalt magnets for its excitation. As part of its normal operation, the converter regulates each output wave in frequency and in voltage providing the necessary voltage regulation for a permanent magnet (PM) generator. The cycloconverter is capable of reverse power flow and the PM generator has the necessary excitation at standstill to make it possible to run the system as a brushless starter. Attention is given to the phases of the development program, system operation, start mode operation, and test results. It is pointed out that the PM VSCF system offers a significant improvement in electrical generating system efficiency over presently used systems. G.R.

A82-11725 # **Unsolved problems of nickel cadmium batteries.** S. Gross (Boeing Aerospace Co., Seattle, WA). In: Intersociety Energy Conversion Engineering Conference, 16th, Atlanta, GA, August 9-14, 1981, Proceedings. Volume 1. New York, American Society of Mechanical Engineers, 1981, p. 177-181. 8 refs.

A number of problems occurring with nickel cadmium battery systems are primarily important for aerospace applications, where reliable, long life is essential. Some of the problems are related to the design of plaques to obtain a large capacity and a long operational life. Other subjects investigated are nickel electrode morphology changes, nickel electrode cycling degradation, and the effects of cadmium migration. It is found that more work is needed for a better understanding of the various factors involved. The development of a computerized mathematical model of the nickel cadmium cell is suggested. The effects produced by electrode additives are also discussed. G.R.

A82-11740 # **High voltage surge and partial discharge test to evaluate aerospace equipment parts.** W. G. Dunbar (Boeing Aerospace Co., Seattle, WA) and D. Schweickart (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). In: Intersociety Energy Conversion Engineering Conference, 16th, Atlanta, GA, August 9-14, 1981, Proceedings. Volume 1. New York, American Society of Mechanical Engineers, 1981, p. 250-254.

Eight test articles were selected for high voltage evaluation to verify the specifications. The test articles represent critical components of a high-voltage, high-power airborne system. A description is presented of the findings of these tests in the case of the capacitors. Each capacitor was given preliminary tests to determine insulation resistance at 100 volts dc, and the capacity using a standard ASTM capacitance bridge at low voltage. It was found that the insulation resistance and capacitance test methods and parameters are acceptable. The partial discharge and dielectric withstanding voltage and surge test methods are acceptable, but the test parameters for airborne capacitors must be lower than those specified for commercial capacitors. G.R.

A82-11890 **Increasing the lift:drag ratio of a flat delta wing.** A. A. Mattick and J. L. Stollery (Cranfield Institute of Technology, Cranfield, Beds., England). *Aeronautical Journal,* vol. 85, Oct. 1981, p. 379-386.

Increases in the lift/drag (L/D) ratio attained by placing flaps on the upper surface of a flat, 60 deg, small aspect ratio delta wing are reported. The flaps were positioned along a ray from the vertex of the wing; their height, increasing from the vertex to the trailing edge, was a percentage of the semispan, and they were hinged at the lower edge. Position and heights were varied and lift and drag forces were measured over a range of angles of attack. The flaps were found to cause a lift force to act on themselves, up to a height of 6.1% of the semispan, by causing air from the primary vortex core to separate and form a vortex on the outboard side of the flaps. A maximum increase of 33% in the L/D was determined and it is noted that all the vertical flaps tested produced a positive thrust force. Graphs are provided of the derived aerodynamic ratios. M.S.K.

A82-11927 # **Fast and accurate gyrocompass using strapdown tuned rotor gyros as a solution to combat helicopters navigation problems.** P. Lloret, X. Lagarde, and G. Lavoipierre (Société d'Applications Générales d'Electricité et de Mécanique, Paris, France). In: Symposium Gyro Technology 1980; Proceedings of the Symposium, Stuttgart, West Germany, September 24, 25, 1980. Düsseldorf, Deutsche Gesellschaft für Ortung und Navigation, 1981, p. 1.0-1.25.

Results of verification tests to determine if gyrocompass mechanization can be used to find true headings within 0.5 deg in less than two minutes for helicopter navigation are presented. A strapdown inertial-Doppler navigation system which uses a pair of two-axis tuned rotor gyroscopes is described. The high accuracy of mechancial gyroscopes is attributed to the repeatability of the thermal behavior of tuned rotor gyroscopes. The gyros were temperature measured externally and in the instrument block, and correlations were sought between temperatures and drift patterns. Although true correlations were necessarily synthetic, drift rates of 15 deg/hr were reduced to 0.5 deg/hr peak residual drifts, confirming the potential use of 0.5 deg accuracy, two minute true heading mechanical gyroscopes as a complement to magnetic headings. M.S.K.

A82-11932 # **Design and development of a low cost servoed rate gyro for unmanned aircraft.** D. R. McKenzie (Smiths Industries Aerospace and Defence Systems Co., Cheltenham, Glos., England). In: Symposium Gyro Technology 1980; Proceedings of the Symposium, Stuttgart, West Germany, September 24, 25, 1980. Düsseldorf, Deutsche Gesellschaft für Ortung und Navigation, 1981, p. 14.0-14.56.

The development of a low cost rate gyro for use in unmanned vehicles is presented. The design parameters for the low weight gyro, which has an input range of plus or minus 50 deg/sec and can operate from a low voltage dc power source are outlined. A conventional design, comprising a spinning rotor on a gimbal with torque restraint and dynamic damping, was chosen to minimize cost and time; a feedback approach was adopted to maintain performance stability. A rotational speed of 10,000 rpm with a polar moment of inertia of 20 g/sq cm was selected. The pick-off, torque motor, servoamplifier, and plastic molding are discussed and performance figures for 25 gyros are presented. A pulsed motor circuit was developed to maintain motor speed within 7% of the set value over the operating temperature range; elimination of a wheel speed control improved nonlinearity and reduced costs. Circuitry diagrams and schematics are provided. M.S.K.

A82-11933 # **Design considerations for the direct digital control of dry-tuned gyroscope.** S. N. Puri (Indian Space Research Organization, Vikram Sarabhai Space Centre, Trivandrum, India). In: Symposium Gyro Technology 1980; Proceedings of the Symposium, Stuttgart, West Germany, September 24, 25, 1980. Düsseldorf, Deutsche Gesellschaft für Ortung und Navigation, 1981, p. 15.0-15.25.

The use of direct digital processor control of dry-tuned gyros is examined. Direct control is implemented because of a finite processing time lag between input and output, and is aided by minimizing the computation time by compensating for the effects of rounding coefficients in the control algorithm. The minimum settling time is discussed analytically and a design is developed that reduces complexity in the control function, offers lower torque demands, and has acceptably small steady state error. A retarded response is mentioned, and the use of a digital processor is found to add delays in the rebalance loops, requiring specific positioning of zeroes in the determinant of the pulse transfer function. An example is given, noting that pick-off noise at the spin frequency or its harmonics can be eliminated by use of a notch filter. Finally, a compromise is viewed as possible if slightly increased overshoot and settling time are found acceptable with a prescribed computing delay. M.S.K.

A82-11934 **Digital avionics - Promise and practice; Proceedings of the Joint Symposium, London, England, March 20, 1980.** Symposium sponsored by the Royal Aeronautical Society and Institution of Electrical Engineers. London, Royal Aeronautical Society, 1981. 72 p.

Papers presented at the symposium provide an overview of the current status of digital avionic systems with emphasis on the practical experience in operating these systems, achievements and problems, and advanced technologies available. Topics discussed include: the influence of digital techniques on system architecture, certification of digital systems, the all digital military aircraft, and an airline's experience in the field. V.L.

A82-11937 # **The all digital military aircraft.** D. Roughton (British Aerospace Public, Ltd., Co., Brough, England). In: Digital avionics - Promise and practice; Proceedings of the Joint Symposium, London, England, March 20, 1980. London, Royal Aeronautical Society, 1981. 14 p.

Developments in avionic systems over the past two decades are reviewed. The main factor that emerges is the conflict between the increasing complexity required to meet operational demands and the need for simplicity of operation to ease the workload of the reduced aircrew. In future aircraft, as the number and type of systems continue to grow, system integration and system automation are essential to ensure that the pilot workload is kept at an acceptable level. V.L.

A82-11938 # **The digital civil aircraft.** J. F. Moore (British Aerospace Public, Ltd., Co., Aircraft Group Div., Bristol, England). In: Digital avionics - Promise and practice; Proceedings of the Joint Symposium, London, England, March 20, 1980. London, Royal Aeronautical Society, 1981. 16 p.

The development of digital avionics is reviewed with particular reference to application in civil aircraft. Examples of in-service systems in which digital technology has been already implemented are examined, including inertial navigation systems, aircraft integrated data systems/accident data recording, multiplexing systems, and the air intake control system of Concorde. Attention is given to the potential benefits of new applications, current developments, practical aspects, and implications of functional integration. Finally, future applications are discussed such as full digital engine control and flight controls (fly-by-wire system). V.L.

A82-11940 # **The certification of digital systems.** D. J. Hawkes (Civil Aviation Authority, London, England). In: Digital avionics - Promise and practice; Proceedings of the Joint Symposium, London, England, March 20, 1980. London, Royal Aeronautical Society, 1981. 12 p. 9 refs.

The present situation in the field of airworthiness certification of digital systems is reviewed and the future certification task is examined with emphasis on safety-critical applications. It is shown that the existing certification requirements are adequate for the new generation of digital systems. For the foreseeable future, the certification task will be very similar to that currently undertaken and will involve performance verification, environmental testing, and safety analyses. The certification task will be refined and judgement will be improved as the weaknesses and peculiarities of digital systems are exposed. V.L.

A82-11941 # **Digital avionics systems - The RAF experience.** B. J. Hunter (RAF, London, England). In: Digital avionics - Promise and practice; Proceedings of the Joint Symposium, London, England, March 20, 1980. London, Royal Aeronautical Society, 1981. 6 p.

The RAF's practical experience in operating digital avionic systems is reviewed with reference to a computer-based navigation and attack system that forms part of a pilot/aircraft control loop for navigation, weapon aiming, and flight direction installed on Jaguar aircraft. The system has proved to be flexible and reliable; modifications of the system can now be accomplished by a software, rather than hardware, change; and the first and second line testing has been reduced. The software maintenance practice and management are discussed in detail. V.L.

A82-11942 # **Digital avionics: Promise and practice - An airlines experience in the field.** J. E. Mills (British Airways, Hounslow, Middx., England). In: Digital avionics - Promise and practice; Proceedings of the Joint Symposium, London, England, March 20, 1980. London, Royal Aeronautical Society, 1981. 4 p.

The British Airways experience with digital avionic systems is reviewed with regard to the initial expectations, achievements, and maintenance and engineering problems encountered. It is shown that the introduction of digital systems into civil aviation did not produce the promised increase in reliability, the self test results being particularly disappointing. However, no maintenance problems of any great significance have been encountered. It is expected that the use of custom LSI and microprocessors will diminish problems previously associated with hardware and will provide improved reliability and more competent self test and monitoring, leading to improved first line servicing. V.L.

A82-11997 # **The CIVIC - A concept in vortex induced combustion.** H. J. R. Shekleton (Solar Turbines International, Turbomach Div., San Diego, CA). *(American Society of Mechanical Engineers, International Gas Turbine Conference, Houston, TX, Mar. 8-12, 1981, Paper 81-GT-12.) ASME Transactions, Journal of Engineering for Power*, vol. 103, Oct. 1981, p. 708-717. 34 refs.

The development of vortex induced combustion is reviewed, noting that the modelling is based on convective processes in unequally heated adjacent air masses. The aerodynamics of vortex flow are analytically examined, and reaction criteria in gas turbine and reciprocating engine vortex combustors are presented. Buoyant mixing to achieve fast, near constant volume combustion in diesel engines is described for two cases. Use of a rotating cup fuel injector in a 10 kW gas turbine to provide good atomization with viscous fluids, even in arctic conditions, is discussed, including a new design feature which avoids injecting the fuel mist into the swirl air. Test results and schematics are presented of various applications, stressing the ability of vortex induced combustion to display efficiencies with standard liquid fuels usually obtained only with natural gas. M.S.K.

A82-11999 * # **Thermal expansion accommodation in a jet engine frame.** M. H. Schneider (General Electric Co., Cincinnati, OH). *(American Society of Mechanical Engineers, Gas Turbine Conference and Products Show, Houston, TX, Mar. 9-12, 1981.) ASME Transactions, Journal of Engineering for Power*, vol. 103, Oct. 1981, p. 776-780. Contract No. NAS3-20643.

Design advancements to enhance stress accommodation in gas turbine engine frames are described. Consideration is given to mechanical stiffness to maintain an adequate spring rate, and to thermal stresses in both ambient and transient modes. Noting that thermal stresses occur due to differing temperatures at different parts of the frame, the matching of the thermal expansion rates of different structural materials is emphasized. Adequate stiffness is necessary to avoid dynamic reactions leading to case cracking as a result of normal imbalances of moving parts. Stress and deflection analysis of a total frame concept using a three-dimensional finite element stress analysis computer program, with modelling of all frame components, is presented, and illustrations are provided. M.S.K.

A82-12021 † **Jet fuel from carbon (Reaktivnoe toplivo iz uglia).** A. A. Krichko, M. K. Iulin, A. C. Arifulin, T. C. Nikiforova, and V. A. Puchkov (Akademiia Nauk SSSR, Institut Goriuchikh Iskopaemykh, Moscow, USSR). *Khimiia i Tekhnologiia Topliv i Masel,* no. 9, 1981, p. 3-5. 8 refs. In Russian.

A jet fuel of the T-8V type has been obtained by isomerization and hydrogenation at 4 MPa of the hydrorefined 180-320 C fraction of a liquid-phase carbon hydrogenation product. The flow scheme and the material balance of the process are presented. V.L.

A82-12022 † **A protective additive for jet fuels (Zashchitnaia prisadka k reaktivnym toplivam).** O. P. Lykov, G. I. Shor, V. P. Lapin, V. V. Sashevskii, and L. I. Mosina (Moskovskii Institut Neftekhimicheskoi i Gazovoi Promyshlennosti, Moscow, USSR). *Khimiia i Tekhnologiia Topliv i Masel,* no. 10, 1981, p. 37-40. 6 refs. In Russian.

A study has been carried out to investigate the protective action of an additive to jet fuels which consists of a mixture of dimers and trimers of synthetic fat acids. Results indicate that there exists a correlation between changes in the protective properties of the fuel as a function of the additive content, on the one hand, and changes in certain electrophysical characteristics of the fuel (e.g., conductivity, contact potential difference change, and electrifiability), on the other hand. V.L.

A82-12025 * **Design predictions for noise control in the cryogenic National Transonic Facility.** W. S. Lassiter (NASA, Langley Research Center, Hampton, VA). *Noise Control Engineering,* vol. 17, Sept.-Oct. 1981, p. 76-84. 6 refs.

Noise control in the National Transonic Facility - a cryogenic wind tunnel - has been examined in terms of acoustical design criteria, drive-fan noise and exhaust system noise. A duct lining with two layers of perforated sheeting and a gas-filled honeycomb core was selected for attenuating drive-fan noise. With the exception of attenuation peaks, attenuation of the lining was found to experimentally agree with predicted values at 20 C air temperatures. Exhaust system noise will be attenuated with a large muffler used in conjunction with a 6.1-m high acoustical enclosure. Fan noise from the fan-ejector system will be attenuated by fan silencers and the acoustic enclosure. S.C.S.

A82-12026 **Emerging technologies in aerospace structures, design, structural dynamics and materials; Proceedings of the Aerospace Conference, San Francisco, CA, August 13-15, 1980.** Conference sponsored by the American Society of Mechanical Engineers. Edited by J. R. Vinson (Delaware, University, Newark, DE). New York, American Society of Mechanical Engineers, 1980. 333 p. $20.

Topics discussed include the emerging technologies in composite materials structures, in materials, and in structural dynamics, shock and impact. Particular attention is given to impact-initiated damage thresholds, adhesively bonded joints in composites, stress concentrations in bonded multilayer stiffened strips and base plates, and the fatigue life of coldworked holes. Consideration is also given to the response of nonlinear aircraft structural panels to high intensity noise, the dynamic numerical analysis of crack initiation, fast crack propagation and crack arrest, and the energy release rate of a penny-shaped crack at the fiber-end of a composite. J.F.

A82-12028 * # **Impact-initiated damage thresholds in composites.** A. V. Sharma (North Carolina Agricultural and Technical State University, Greensboro, NC). In: Emerging technologies in aerospace structures, design, structural dynamics and materials; Proceedings of the Aerospace Conference, San Francisco, CA, August 13-15, 1980. New York, American Society of Mechanical Engineers, 1980, p. 11-26. 10 refs. Grant No. NsG-1296.

An experimental investigation was conducted to study the effect of low velocity projectile impact on the sandwich-type structural components. The materials used in the fabrication of the impact surface were graphite-, Kevlar-, and boron-fibers with appropriate epoxy matrices. The testing of the specimens was performed at moderately low- and high-temperatures as well as at room temperature to assess the impact-initiated strength degradation of the laminates. Eleven laminates with different stacking sequences, orientations, and thicknesses were tested. The low energy projectile impact is considered to simulate the damage caused by runway debris, dropping of the hand tools during servicing, etc., on the secondary aircraft structures fabricated with the composite materials. The results show the preload and the impact energy combinations necessary to cause catastrophic failures in the laminates tested. A set of faired curves indicating the failure thresholds is shown separately for the tension- and compression-loaded laminates. The specific-strengths and -moduli for the various laminates tested are also given. (Author)

A82-12039 # **Coupled fluid/structure response predictions for soft body impact of airfoil configurations.** J. J. Engblom (United Technologies Corp., Government Products Div., West Palm Beach, FL). In: Emerging technologies in aerospace structures, design, structural dynamics and materials; Proceedings of the Aerospace Conference, San Francisco, CA, August 13-15, 1980. New York, American Society of Mechanical Engineers, 1980, p. 209-223. 8 refs. Research supported by the United Technologies Corp.

Jet engine overhaul costs related to foreign object damages (FOD) are a significant concern in aircraft operations. Present FOD design systems, however, are not applicable to advanced airfoil configurations. An analytical design tool has therefore been developed to improve the FOD response prediction capability for the soft body impact of metal or composite fan blades, and is implemented by a finite element computer code. The basic approach involves coupling a fluid loading model with a structural model for the blade. Iterative effects are included in the solution, i.e., applied loads are a function of the structural response. Solutions include the effects of large displacement (geometric) and material (inelastic) nonlinearities. The code is also modified to treat the response of hybrid composite materials, demonstrating its capability to meet impact response predictions for complex metal or composite airfoil configurations. It is concluded that the analysis can be used to support the design of future high tip speed FOD-tolerant fan blades. J.F.

A82-12041 # **Response of nonlinear aircraft structural panels to high intensity noise.** C. Mei (Old Dominion University, Norfolk, VA). In: Emerging technologies in aerospace structures, design, structural dynamics and materials; Proceedings of the Aerospace Conference, San Francisco, CA, August 13-15, 1980. New York, American Society of Mechanical Engineers, 1980, p. 245-272. 17 refs. Contract No. F49620-79-C-0169.

Design methods and design criteria for sonic fatigue prevention have been developed based on analytical and experimental techniques. This paper presents an analytical method for predicting the response of rectangular nonlinear structural panels subjected to broadband random acoustic excitation. The formulation is based on the Karman-Herrmann large deflection plate equations, a single-mode Galerkin approximation, the equivalent linearization method, and an iterative procedure. Both simply-supported and clamped-support conditions with immovable or movable inplane edges are considered. Panel mean-square deflection, maximum mean-square stress, and equivalent linear frequency at various acoustic loadings are determined and presented in graphical form. The results obtained were shown to agree well with experimental ones, and suggestions for further research are given. J.F.

A82-12043 # **Crack growth evaluation of a method to convert real-time loads history to a simplified engineering spectra.** E. J. Ferko (Lockheed-Georgia Co., Marietta, GA). In: Emerging technologies in aerospace structures, design, structural dynamics and materials; Proceedings of the Aerospace Conference, San Francisco, CA, August 13-15, 1980. New York, American Society of Mechanical Engineers, 1980, p. 285-294. 6 refs.

The random and independent nature of shear and axial stresses due to gust sources poses a complex problem for the structural analysis of cracks emanating from fastener holes in spanwise and beam-web splices of a transport aircraft wing. A practical engineering solution to the shear/axial stress interaction problem was developed for the C-5A wing, and a box beam test program was conducted to evaluate the solution. The evaluation was accomplished by comparing crack propagation rates generated by testing flight measured real time histories (RTH) with the engineering solution (referred to as the Equivalent Analytical Representation spectra). The baseline RTH spectra consisted of loads data recorded during dynamic response flight testing. The EAR spectra was derived from the aforementioned RTH data and was analytically developed utilizing peak counting methods and the empirical shear/axial stress interaction solution. Fractographic correlation of numerous cracks indicated that the EAR spectra adequately simulated the random nature of shear and axial stresses in the RTH data. (Author)

A82-12045 # **Numerical treatment of helicopter rotor stability problems.** R. Vepa and T. S. Balasubramanian (National Aeronautical Laboratory, Bangalore, India). In: Emerging technologies in aerospace structures, design, structural dynamics and materials; Proceedings of the Aerospace Conference, San Francisco, CA, August 13-15, 1980. New York, American Society of Mechanical Engineers, 1980, p. 307-319. 14 refs. Research supported by the Ministry of Defence.

The problem of calculating the Floquet transition matrix for parametric stability problems is considered. A new method of calculating the transition matrix with a minimum number of time steps is described. The method is shown to be extremely efficient for a wide class of helicopter stability problems, including flapping stability of a helicopter rotor, helicopter ground resonance with a nonisotropic rotor and pitch-flap-bending stability of a helicopter rotor in forward flight. The relationship of the method to the classical method of averaging is pointed out. (Author)

A82-12048 **ACMA - Fact or fantasy.** W. T. Mikolowsky and W. A. Garrett (Lockheed-Georgia Co., Marietta, GA). *Lockheed Horizons,* Fall 1981, p. 2-12.

The feasibility of the advanced civilian/military aircraft (ACMA) for use as both an advanced military airlift vehicle and a commercial airfreighter is discussed. A partnership in development between government and industry is expressed as necessary to reduce costs through larger production quantities, to increase emergency airlift capabilities in the Civil Reserve Air Fleet, and commercial maintenance of military aircraft. Design options and requirements are presented along with timetables, showing production delivery to commence in 1994. Topics such as commercial need, energy use, engine design, and financial planning are examined, with emphasis on system features that enhance the commercial attractiveness of the vehicle. A preliminary configuration shows a payload capability of 390,000 lbs with a fuel efficiency 50% better than that of the 747-200F. M.S.K.

A82-12049 **History of flight testing the L-1011 TriStar jet transport. II - Testing highlights since initial certification of the L-1011-1.** R. J. Gatineau (Lockheed-California Co., Palmdale, CA). *Lockheed Horizons,* Fall 1981, p. 14-29.

A82-12087 # **Considerations and applications for the use of fluidics in aerospace controls.** T. G. Sutton (AiResearch Manufacturing Company of Arizona, Phoenix, AZ). In: 20th Anniversary of Fluidics Symposium, Chicago, IL, November 16-21, 1980, Proceedings. New York, American Society of Mechanical Engineers, 1980, p. 73-79. 6 refs.

Fluidics technology has been considered for use in controls in aerospace environments in order to obtain reliable and cost-effective systems. While many applications involving fluidics have been in production for several years, there have been a number of failures while attempting to apply fluidics technology to aerospace applications. Because of this, fluidic techniques must be very carefully evaluated for any application before being considered as the most desirable technology to be used. An overview is given of design parameters which must be given due consideration by the fluidic system designer. Included are the interfacing of the technology with other system components. Case histories of three fluidic control applications are cited. C.R.

A82-12100 **Quantification of the thermal environment for externally carried aircraft stores and ordnance.** H. Schafer and I. Barbe (U.S. Naval Weapons Center, China Lake, CA). *Journal of Environmental Sciences,* vol. 24, Sept.-Oct. 1981, p. 23-26.

Thermal testing procedures for aircraft external stores and ordnance are discussed, noting the importance of considering the entire range of possible thermal environments for each tested component. A method is proposed in which necessary parameters of environmental variables such as aircraft speed, altitude, air temperature, and amount of fuel available are considered in terms of percentiles. A Gaussian distribution is assumed for each environmental range, enabling for example, the elimination of extreme high and low flight speeds from average environment estimates. Use of the Arnold Research and Development Center standard atmosphere was found to be preferrable for engineering considerations because of inherent biasing errors in the MIL-STD-210 hot and cold data atmosphere. Techniques of cross-correlating environmental percentiles are defined, and it is emphasized that thermal gradients cause the greatest hardware performance degradation. M.S.K.

A82-12107 # **The dispersion of drop sizes in gas turbine fuel nozzle sprays.** D. L. Markham (Ex-Cell-O Corp., Walled Lake, MI). In: Fluid mechanics of combustion systems; Proceedings of the Fluids Engineering Conference, Boulder, CO, June 22, 23, 1981. New York, American Society of Mechanical Engineers, 1981, p. 95-100. 6 refs.

The dispersion of drop sizes in sprays as produced by gas turbine fuel nozzles was studied by conducting a large number of tests on several fuel nozzle sprays using a Malvern ST1800 Particle and Droplet Size Distribution Analyzer. It is found that the size dispersion of a spray depends on the location where the spray cloud is sampled, nozzle type, and nozzle operating condition. It is concluded that to fully specify the drop size characteristics of a gas turbine fuel nozzle spray, not only must the mean drop size of the drop size distribution be reported, but also the drop size dispersion. P.T.H.

A82-12118 # **Application of numerical modeling to gas turbine combustor development problems.** G. J. Sturgess, S. A. Syed, and D. Sepulveda (United Technologies Corp., Commercial Products Div., East Hartford, CT). In: Fluid mechanics of combustion systems; Proceedings of the Fluids Engineering Conference, Boulder, CO, June 22, 23, 1981. New York, American Society of Mechanical Engineers, 1981, p. 241-250. 23 refs.

The effects of dome cooling air changes in an experimental combustor for a large, turbofan gas turbine engine are investigated by means of perturbation studies carried out with numerical modeling. Two geometrical configurations are examined at high engine power levels, and calculated changes in the flow fields are compared with evidence obtained from experimental engines. Changes in dome and liner pressure drops are observed with severe dome distress in one of the configurations. It is concluded that the combustor simulations are qualitatively correct and have satisfactory quantitative agreement without requiring exact geometrical representations. D.L.G.

A82-12120 * # **On the prediction of swirling flowfields found in axisymmetric combustor geometries.** D. L. Rhode, D. G. Lilley, and D. K. McLaughlin (Oklahoma State University, Stillwater, OK). In: Fluid mechanics of combustion systems; Proceedings of the Fluids Engineering Conference, Boulder, CO, June 22, 23, 1981. New York, American Society of Mechanical Engineers, 1981, p. 257-266. 32 refs. Grant No. NAG3-74.

The paper reports research restricted to steady turbulence flow in axisymmetric geometries under low speed and nonreacting conditions. Numerical computations are performed for a basic two-dimensional axisymmetrical flow field similar to that found in a conventional gas turbine combustor. Calculations include a stairstep boundary representation of the expansion flow, a conventional k-epsilon turbulence model and realistic accomodation of swirl effects. A preliminary evaluation of the accuracy of computed flowfields is accomplished by comparisons with flow visualizations using neutrally-buoyant helium-filled soap bubbles as tracer particles.

Comparisons of calculated results show good agreement, and it is found that a problem in swirling flows is the accuracy with which the sizes and shapes of the recirculation zones may be predicted, which may be attributed to the quality of the turbulence model. D.L.G.

A82-12149 **Determination of vertical profiles of aerosol size spectra from aircraft radiative flux measurements. II - The effect of particle nonsphericity.** R. M. Welch (Mainz, Universität, Mainz, West Germany), S. K. Cox (Colorado State University, Fort Collins, CO), and K. Ia. Kondrat'ev (Glavnaia Geofizicheskaia Observatoriia, Leningrad, USSR). *Journal of Geophysical Research*, vol. 86, Oct. 20, 1981, p. 9795-9800. 28 refs. NSF Grants No. ATM-78-05743; No. ATM-77-22384.

A82-12170 † **Control of electromechanical actuator elements for flight vehicles (Upravlenie ispolnitel'nymi elementami sledsshchikh elektroprivodov letatel'nykh apparatov).** B. I. Petrov, V. V. Bal'bukh, N. P. Pappe, V. P. Pappe, V. A. Serdiuk, and V. G. Stebletsov. Moscow, Izdatel'stvo Mashinostroenie, 1981. 222 p. 40 refs. In Russian.

The control theory of electromechanical actuator elements is developed with particular reference to application in electrical flight control systems (e.g., for tactical missiles). Attention is given to the use of ac motors and dc motors in such systems, and to digital actuator systems. The limiting dynamic possibilities and energetic characteristics of electromechanical actuators are considered. B.J.

A82-12222 † **The enhancement of heat exchange in channels /2nd revised and enlarged edition/ (Intensifikatsiia teploobmena v kanalakh /2nd revised and enlarged edition/).** E. K. Kalinin, G. A. Dreitser, and S. A. Iarkho. Moscow, Izdatel'stvo Mashinostroenie, 1981. 208 p. 199 refs. In Russian.

An analysis is presented of various means for the enhancement of heat exchange in the heat exchange channels of flight vehicles. The factors governing the selection of heat exchange enhancement method are considered, and specific methods applicable to right channels and longitudinal flow around a bundle of tubes, and curved channels are indicated. Attention is then given to the methods and mechanisms of heat exchange enhancement in pipes, around pipe bundles and in circular channels, in two-dimensional and triangular channels, taking into account the effects of hydraulic resistance and the effectiveness of the various methods is evaluated. The enhancement of heat exchange in the presence of film boiling on the one hand and condensation on the other in channels is also examined. A.L.W.

A82-12267 # **Validation studies of turbulence and combustion models for aircraft gas turbine combustors.** S. A. Syed and G. J. Sturgess (United Technologies Corp., Commercial Products Div., East Hartford, CT). In: Momentum and heat transfer processes in recirculating flows; Proceedings of the Winter Annual Meeting, Chicago, IL, November 16-21, 1980. New York, American Society of Mechanical Engineers, 1980, p. 71-89. 29 refs.

The paper describes work performed as part of a continuing program to explore computational fluid dynamics procedures and related turbulence and combustion models for application to the design, understanding, and development of aircraft gas turbine combustors. Validation studies were conducted using a finite difference procedure (TEACH) to solve the relevant steady, two-dimensional, elliptic transport equations for turbulent flow. The familiar two equation (k-epsilon) turbulence model was used. The combustion model was based on the dissipation rate of oxidant, fuel, and product containing eddies. It was concluded that for confined, nonreacting flows with reasonably well defined boundary conditions, the turbulence model predicts mean flow quantities to an accuracy of about 85 percent in regions of parabolic flow. The size of the recirculation zone is underpredicted by about 15-20 percent, and its strength is underpredicted by 20-25 percent. (Author)

A82-12318 **Extending the limits of reliability theory.** H. Goldberg. New York, Wiley-Interscience, 1981. 275 p. 15 refs. $32.50.

Aspects of probability and statistics are examined, taking into account the objective view of probability, the binomial distribution, the use of probability for prediction, the meaning of the reliability (survivor) function, questions of discrete and continuous distribution, time-to-failure distributions, and distributions found in the reliability literature. Attention is given to the determination of the time-to-failure distribution of a component, the sources of component failure data, the real world of electronic component procurement, the time to first failure for new systems, and system survivor functions for certain component distributions. Redundancy and survivor functions of systems are considered along with questions related to renewal theory and mean time between failures, a Monte Carlo investigation of systems based on normal distributions, and subjects related to precision, confidence, and numbers tested. G.R.

A82-12323 **Antenna theory and design.** W. L. Stutzman (Virginia Polytechnic Institute and State University, Blacksburg, VA) and G. A. Thiele (Dayton, University, Dayton, OH). New York, John Wiley and Sons, 1981. 608 p. 158 refs. $30.95.

Antenna fundamentals and definitions are examined, taking into account electromagnetic fundamentals, the solution of Maxwell's equations for radiation problems, the ideal dipole, the radiation pattern, directivity and gain, reciprocity and antenna pattern measurements, antenna impedance and radiation efficiency, antenna polarization, antennas in communication links and radar, and the receiving properties of antennas. Some simple radiating systems are considered along with arrays, line sources, wire antennas, broadband antennas, moment methods, and aperture antennas. High-frequency methods and aspects of antenna synthesis are discussed, giving attention to geometrical optics, physical optics, wedge diffraction theory, the ray-fixed coordinate system, the cylindrical parabolic antenna, and linear array methods. G.R.

A82-12449 **Commercial EMS considerations for small gas turbine engines.** R. Halliday (Pratt and Whitney of Canada, Ltd., Longueuil, Quebec, Canada). In: Aircraft gas turbine engine monitoring systems; Proceedings of the Aerospace Congress and Exposition, Los Angeles, CA, October 13-16, 1980. Congress and Exposition sponsored by the Society of Automotive Engineers. Warrendale, PA, Society of Automotive Engineers, Inc., 1981, p. 23-26.

It is shown that electronic automated engine monitoring systems (EMS) offer advantages over manual methods for power assurance, trend and limit exceedance monitoring, and low cycle fatigue and creep life recording. System cost, which is the main constraint on EMS for small gas turbines, is proportional to the number of parameters measured. Although EMS cost may preclude a full diagnostic capability, it may be reduced by 'piggy backing' with other systems, such as those for fuel control or flight monitoring. Future EMS are predicted to be part of modular, fully integrated systems employing multiplexing techniques. It is concluded that ARP 1587 is needed for that level of integration to be achieved. Among the parameters monitored by an EMS are turbine temperature, gas generator speed, free turbine speed, output torque, pressure altitude, and outside air temperature. O.C.

A82-12450 **Further application and development of an engine usage/life monitoring system for military services.** R. Holl. In: Aircraft gas turbine engine monitoring systems; Proceedings of the Aerospace Congress and Exposition, Los Angeles, CA, October 13-16, 1980. Congress and Exposition sponsored by the Society of Automotive Engineers. Warrendale, PA, Society of Automotive Engineers, Inc., 1981, p. 27-30.

The Engine Usage Monitoring System (EUMS) which determines the rate and extent to which major and critical components of military engines are being consumed. Rapid development and limited funding constraints led to the production of the Mk I EUMS, which incorporates a Phillips-type magnetic tape cassette as the recording medium and serial digital data formatting and has shown good performance point recording accuracy and reliability. The Mk II development of the EUMS incorporates a microprocessor, a solid state memory, and associated large scale electronics miniaturization and integration. With the addition of a visual display unit, onboard computing/display facility requirements are also satisfied. A civil aviation application of the EUMS is projected on the strength of its basic simplicity and low cost. O.C.

A82-12495 **Powder metallurgy superalloys - Aerospace materials for the 1980's; Proceedings of the Conference, Zurich, Switzerland, November 18-20, 1980. Volume 1.** Shrewsbury, Salop, England, MPR Publishing Services, Ltd., 1980. 237 p.

The conference focused on the latest advances in the powder metallurgy of superalloys, including developments in powder production, consolidation, and shape-making techniques, and applications. Papers are presented on the novel aspects for high-quality metal powder production equipment, oxide dispersion strengthened materials by mechanical alloying, potential for PM superalloys in aero engine application, HIP systems for superalloys, and electron-beam welding of PM nickel-base superalloys. V.L.

A82-12496 **Superclean superalloy powders by the rotating electrode process.** P. Loewenstein (Nuclear Metals, Inc., Concord, MA). In: Powder metallurgy superalloys - Aerospace materials for the 1980's; Proceedings of the Conference, Zurich, Switzerland, November 18-20, 1980. Volume 1. Shrewsbury, Salop, England, MPR Publishing Services, Ltd., 1980, p. 7, 7-1 to 7-28. 18 refs.

A REP (rotating electrode process) powder system with inert gas handling has been developed for the manufacture of 'superclean' superalloy powders for fatigue-critical turbine applications. The system employs a noncontaminating plasma arc source and input electrodes in the form of precision ground bars that are free from nonmetallic inclusions. The production capability of the superalloy powder facility is approximately 500,000 kg per year. V.L.

A82-12497 **Superalloy turbine components - Which is the superior manufacturing process, as-HIP, HIP plus Isoforge, or 'gatorizing' of extrusion consolidated billet.** J. Coyne, W. H. Couts, C. Chen, and R. P. Roehm (Wyman-Gordon Co., North Grafton and Worcester, MA). In: Powder metallurgy superalloys - Aerospace materials for the 1980's; Proceedings of the Conference, Zurich, Switzerland, November 18-20, 1980. Volume 1.
Shrewsbury, Salop, England, MPR Publishing Services, Ltd., 1980, p. 11, 11-1 to 11-31.

Identical parts of superalloys IN-100, René 95, MERL-76, AF-115, and Astroloy, which are being considered for turbine engine applications, have been produced by three different powder metallurgy techniques: as-HIP, HIP plus Isoforge, and gatorizing of extrusion-consolidated billet. The mechanical properties of parts produced by the different processes are found to be equivalent. Thus, the choice of a process should be based on factors other than the currently expected mechanical properties; namely, materials utilization, inspectability, and economics. V.L.

A82-12499 **Superalloy powder engine components; controls employed to assure high quality hardware.** J. E. Coyne, W. H. Everett, and S. C. Jain (Wyman-Gordon Co., North Grafton and Worcester, MA). In: Powder metallurgy superalloys - Aerospace materials for the 1980's; Proceedings of the Conference, Zurich, Switzerland, November 18-20, 1980. Volume 1.
Shrewsbury, Salop, England, MPR Publishing Services, Ltd., 1980, p. 24, 24-1 to 24-27.

A program involving the production of several hundred turbine engine components from René 95 alloy is reviewed. Consideration is given to powder transportation and handling, development of stock acceptance tests and quality assurance program, precautions taken to avoid powder contamination in the process of handling prior to HIP'ing, and final testing. Examples of crack initiating defects and their effect on mechanical properties are included. V.L.

A82-12560 # **Lineup of the IM-series aircraft-derivative gas turbines.** *Ishikawajima-Harima Engineering Review,* vol. 21, July 1981, p. 279-285. 13 refs. In Japanese, with abstract in English.

In order to establish the reliability of the power turbines to be developed by IHI, extensive investigations are carried out, in particular, on the rotor assemblies. With engine test runs using actual IM5000 gas turbines, confirmation of the power turbine blade vibratory stress is carried out through the whole operating range. The measured stress levels reveal that they are far below the critical limits and that no detrimental resonance is to be expected. The same procedure is used with the IM2500 power turbine. In addition to analyses of the rotating parts, the various stationary parts are tested, especially the transient behavior of the casing for quick thermal response at the time of starting, stopping and emergency shutdown of the engine. C.R.

A82-12563 **Fuel conservation - DC-9 series 20/30/40.** *Society of Flight Test Engineers, Journal,* vol. 3, Sept. 1981, p. 2-17.

Operational performance penalties and approximate fuel costs associated with the aerodynamics, flight operations, fuel gage system and performance analysis aspects of the DC-9 Series 20, 30 and 40 aircraft are presented. Degradations in aerodynamic cleanness, caused by the gradual deterioration of various seals, rigging adjustments and skin surface smoothness, are shown to lead to drag increases of less than 0.5%, which, however, represents a significant cost in view of the amount of fuel consumed. Flying off-optimum altitude or Mach number may result in excess fuel expenditures greater than those due to degraded aerodynamic cleanness. Other operational factors with substantial influence on fuel use include fuel or aircraft weight, center of gravity, flight time, the use of automatic flight control systems, APU operation, engine starting times, takeoff procedures, climb speed, en route profile, descent profile, and approach maneuvers. The DC-9 fuel gage system has been designed to be as accurate as possible in all phases, in order to minimize the necessity of carrying excess fuel for a given flight. Finally, investigations of aircraft performance may be used to identify areas requiring correction through the comparison of the indicated performance level against a reference, the assessment of engine and airframe contributions, and the investigation of the most likely areas for correction - the external control surfaces and internal systems. S.C.S.

A82-12564 **Procedures and analysis techniques for determining static air minimum control speeds.** E. N. Bradfield (USAF, Flight Test Center, Edwards AFB, CA). *Society of Flight Test Engineers, Journal,* vol. 3, Sept. 1981, p. 18-48. 6 refs.

A method is presented which can be used to establish the minimum air speed required for the static lateral and directional control of a multiengined aircraft following the failure of one or more engines. Equations for the thrust moment and rudder pedal force coefficient in an asymmetrical force condition are derived from minimum directional control speed theory, and applied to the analysis of data obtained in climbs of the B-57 aircraft through a significant altitude band at minimum directional control speed with wings level and banked at various angles, and with a rudder power assist system both operational and inoperative. An analysis procedure is also presented for aircraft for which minimum control is defined by the lack of lateral, rather than directional control, such as STOL and powered-lift aircraft. These methods allow minimum control speed testing to be accomplished safely, without the necessity of flying at extreme low altitudes with an engine shut down, and permit extrapolation to off-standard-day conditions and various gross weights. S.C.S.

A82-12626 **National Aerospace Meeting, Trevose, PA, April 8-10, 1981, Proceedings.** Meeting sponsored by the Institute of Navigation. Washington, DC, Institute of Navigation, 1981. 190 p.

Papers are presented on such topics as all-digital GPS receiver mechanization, worldwide coverage of the Phase II Navstar satellite constellation, real-time missile tracking with GPS, navigation task partitioning in distributed-processing avionics systems, and memory requirements for future aerospace navigation systems. Consideration is also given to the simulation study of a hybrid strapdown attitude and heading reference system, a comparative study of strapdown algorithms, ring laser gyro navigator flight test results, and size effects in strapdown navigators. P.T.H.

A82-12630 # **Satellite geometry considerations for low cost GPS user equipment.** Y. Rosenthal (Intermetrics, Inc., Cambridge, MA). In: National Aerospace Meeting, Trevose, PA, April 8-10, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 30-32. FAA-supported research.

The paper evaluates the geometrical properties of various GPS satellite configurations as seen by a low-cost user equipment designed for use by general aviation (GA). The GA user is equipped with one antenna which covers an 86-deg cone perpendicular to the plane of the aircraft. Therefore, when the aircraft banks, satellites which are above the horizon may be shadowed. Through a nominal turn at a bank angle of 25 deg, the identity of the visible satellites is changing rapidly. Hence, preselection of the best four satellites is impossible. Criteria for comparing 24 satellites from the GA user point of view is presented, as well as some preliminary results which indicate the different results provided by different constellations. Results show that as far as GA is concerned, the coverage provided by various 24 satellite constellations is not of equal value. P.T.H.

A82-12634 # **A solution to the static geometry problem for JTIDS relative navigation.** R. Weiss (Intermetrics, Inc., Cambridge, MA) and P. Asher (USAF, Joint Program Office, Bedford, MA). In: National Aerospace Meeting, Trevose, PA, April 8-10, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 62-64.

The current JTIDS (Joint Technical Information Distribution System) relative navigation algorithm restricts the use of relative position data in order to maintain stability. In a static geometry situation, the position quality will be degraded. This paper proposes a solution to the static geometry problem which involves a second source that maintains a high position quality by constraining its covariance matrix. There are several ways to implement this situation, each of which must be evaluated in a simulation environment for scenarios involving transitions from static geometry to normal mode. P.T.H.

A82-12636 # **Hard limited approaches to correlation velocity sensing.** T. J. Lund, R. E. Chapman, and G. A. Murdock (Teledyne, Inc., Teledyne Ryan Electronics, San Diego, CA). In: National Aerospace Meeting, Trevose, PA, April 8-10, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 79-83. 6 refs.

Correlation velocity sensors determine velocity by measuring the time delay required for best correlation between signals gathered by two downward looking radar receiver antennas having known separation along the velocity axis being measured. This paper discusses a variation of this basic technique in which the received signals are hard limited such that correlation is only performed on the phase of the signal. The hard limiting approach avoids the need for AGC and allows the receiver outputs to be applied directly to a digital processor. Comparisons of correlation functions are presented for linear correlations on the total signal (phase and amplitude), amplitude only and phase only. It is shown that the correlation properties of hard limited signals are well suited to correlation velocity sensing. The results of simulations of the correlation velocity sensing process, which included a realistic terrain scattering model, are presented for various flight conditions and terrain types. The implementation of a hard limited correlation velocity sensor is discussed. (Author)

A82-12637 # **Memory requirements for future navigation systems.** R. Fedorak (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA) and B. A. Zempolich (U.S. Navy, Naval Air Systems Command, Washington, DC). In: National Aerospace Meeting, Trevose, PA, April 8-10, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 84-89.

The paper examines current problems concerning memories used in aerospace navigation systems, identifies technical management concerns relative to various aspects of current use of specific memory technologies, and discusses memory requirements for future aerospace navigation systems. Particular attention is given to such aspects as nonvolatility, electrical reprogrammable memories, commonality of memory hardware between platforms, packaging, and memory capacity. MNOS EEPROM, MNOS 8K BORAM, MNOS EAROM, and bubble memories are considered. P.T.H.

A82-12638 # **Omega station 10.2 kHz signal selection made easy.** R. R. Gupta and R. S. Warren (Analytic Sciences Corp., Reading, MA). In: National Aerospace Meeting, Trevose, PA, April 8-10, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 90-103. 7 refs.

Recently developed Omega station signal coverage prediction diagrams for 10.2 kHz at eight representative diurnal and seasonal global times of the year provide the most complete presentation of Omega station signal coverage ever available to Omega users. This paper presents minimum and maximum coverage extremes characterized by the coverage diagrams for the eight representative coverage times of the year for two signal selection criteria. A simplified algorithm which yields a conservative determination of the coverage is obtained by using the maximum coverage boundary. The range and bearing coordinates of minimum and maximum SNR boundaries for -20 dB and -30 dB are provided in tabular form for each Omega station. P.T.H.

A82-12639 # **FAA acceptance tests on the NAVSTAR GPS Z-Set receiver.** R. J. Esposito (FAA, Technical Center, Atlantic City, NJ). In: National Aerospace Meeting, Trevose, PA, April 8-10, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 104-107.

This paper describes FAA acceptance tests on the NAVSTAR GPS Z-Set receiver which were conducted in a USAF System Command C-141 aircraft over the instrumented range located at the Yuma Proving Ground. The Yuma laser tracking system computed a reference trajectory against which the GPS receiver solution was compared. Data from five flights, totalling over six hours, are presented with the objective of assessing Z-Set capabilities to meet civil aviation requirements for non-precision approaches. (Author)

A82-12640 # **A navigation systems planning model.** H. L. Solomon and A. R. Stephenson (Systems Control, Inc., Palo Alto, CA). In: National Aerospace Meeting, Trevose, PA, April 8-10, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 108-119.

The advent of Navstar/GPS has directed the attention of government decision-makers to the possibility of ultimately replacing or supplementing existing navigation systems with one or more alternative systems. To assist these decision-makers in evaluating these and other navigation policy alternatives, a navigation system cost/benefit model is being developed. A comprehensive data base is also being developed from which the appropriate information can be extracted by the model in response to navigation system implementation/decommissioning scenarios, as defined by the model users. The model will predict the user's annualized response to a stipulated scenario in terms of receiver purchases, thereby permitting navigation planners not only to consider operator costs but also the expected costs and benefits on either an individual or combined user group basis. The model's outputs will also be useful to individual user groups in assessing their position vis-a-vis navigation system policy alternatives. P.T.H.

A82-12641 # **Simulation study of a hybrid strapdown attitude and heading reference system.** D. B. Reid, B. N. McWilliam (Philip A. Lapp, Ltd., Toronto, Canada), and D. F. Liang (Defence Research Establishment, Ottawa, Canada). In: National Aerospace Meeting, Trevose, PA, April 8-10, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 139-147. 13 refs.

The aircraft attitude and heading reference system (AHRS) considered in this paper comprises a low-accuracy strapdown inertial measurement unit (IMU), a strapdown magnetometer triad, which provides reference heading information, and air data sensors from which barometric altitude and true airspeed measurements are derived. A variable-dimension U-D factorized Kalman filter is employed to estimate the AHRS error state from the redundant sensor data. Estimated errors are fed back into the system using a combination of continuous and impulsive control methods to bound the inertial attitude, heading, and velocity errors and reduce the rate of position error growth. A data compression algorithm is employed for smoothing of incoming measurement data to enable high-rate information to be incorporated into the filtering process at minimum computational cost. The system operates in three modes: normal AHRS mode, alignment (erection) mode and magnetics calibration mode, in which the U-D filter is utilized to estimate systematic errors in the sensed magnetic field during a ground 'swing' procedure. Initial results obtained by full-scale simulation indicate that, with a low-accuracy strapdown IMU, the system can achieve roll and pitch accuracies of about 5 arc minutes (RMS) and a heading accuracy of approximately .75 degree (RMS). (Author)

A82-12642 # **The integrated inertial sensor assembly /IISA/ - A redundant strapdown system for advanced aircraft navigation and flight control functions.** M. S. Dipasquo (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). In: National Aerospace Meeting, Trevose, PA, April 8-10, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 153-162.

In order to achieve the benefits of an integrated inertial sensor assembly (IISA) for the next generation aircraft, the U.S. Navy has embarked on an advanced development program to demonstrate the IISA concept. This paper examines the requirements definition, the system concept formulation, and the design definition of the advanced development model (ADM) that will be used for concept validation in a later flight test program. P.T.H.

A82-12843 # **Integrated satellite navigation and strapdown attitude and heading reference systems for civil air carriers.** J. J. Hopkins (Navigation Development Services, Inc., Northridge, CA). In: National Aerospace Meeting, Trevose, PA, April 8-10, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 153-170. 17 refs.

The potential of the integrated GPS navigator and the strapdown AHRS as a replacement for several existing avionics systems is investigated. Its application is discussed including the economic impact with regard to acquisition and maintenance. The system components and integration approach are described, and the expectations for favorable performance comparisons with its competition are presented. It is concluded that the economic and performance advantages are unmistakably outstanding. Consequently, to save costs and to safely handle increased traffic there is a strong likelihood that integrated GPS/AHRS will become the standard position, velocity, and attitude reference system for future civil aircraft. P.T.H.

A82-12844 # **Ring Laser Gyro Navigator /RLGN/ flight test results.** K. L. Bachman (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). In: National Aerospace Meeting, Trevose, PA, April 8-10, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 171-178.

This paper describes a flight test program and the resultant navigation performance achieved on an Advanced Development Model (ADM) Ring Laser Gyro Navigator (RLGN) in Navy A-7E and P-3C aircraft. As the RLGN represents a significant departure from conventional gimballed inertial system technology, a brief functional system description is given highlighting key hardware and software design features. This is followed by a description of the A-7E flight test program, its objective, flight profiles, method of data acquisition, and analysis of results. The P-3C flight test program is discussed including a description of the flight test recording instrumentation, flight profiles, data reduction, and analysis of results. An indication of system reliability, maintenance, and calibration actions versus system design goals is given. Effects of high latitude on system alignment and navigation performance are also highlighted. (Author)

A82-12846 **Kevlar composites; Proceedings of the Symposium, El Segundo, CA, December 2, 1980.** Symposium sponsored by the Technology Conferences. El Segundo, CA, Technology Conferences, 1980. 96 p. $24.

Papers presented cover Kevlar-49 properties and Kevlar/epoxy composite materials. Kevlar roles in the aerospace industry were noted in the design of the L-1011 Tristar components, in the materials processing for commercial aircraft, and applications in commuter aircraft; additional papers describe Kevlar use in life-saving equipment, for rocket motors, pressure vessels, and fuel tanks. Finally, the methods and tools necessary for using Kevlar are presented. D.H.K.

A82-12847 **Seven years experience with Kevlar-49 in the Lockheed L-1011 Tristar.** R. H. Stone (Lockheed-California Co., Burbank, CA). In: Kevlar composites; Proceedings of the Symposium, El Segundo, CA, December 2, 1980. El Segundo, CA, Technology Conferences, 1980, p. 25-43.

A history of the use of Kevlar-49 in aircraft structures is presented. The aramid fibers provide a 25-30% weight reduction over fiberglass with 1.5 times the stiffness, in addition to comparable tensile strength; compressive strength is lower, though acceptable. Aircraft parts were fabricated on fiberglass production equipment using epoxy resin prepregs and tested for durability, impact resistance, and flammability; all were found to be comparable to fiberglass. Wing body sandwich fairings, underwing fillet panels, and aft engine fairings were built, tested for aerodynamic loads, and found acceptable in a NASA flight service program. The parts were then mounted on Lockheed L-1011's for use in commercial airline service; after 50,000 flying hours wear was equivalent to the use of fiberglass. Interior and exterior applications in aircraft, such as for rudder and trailing edge flaps, are discussed. D.H.K.

A82-12894 **Wings in the sun - The evolution of Solar Challenger.** M. Cowley. *Flight International*, vol. 119, June 13, 1981, p. 1886-1888.

The design, development and testing of the Solar Challenger aircraft are described, with attention to its lightweight structural design and photovoltaic cell array-powered electric propulsion system. The configuration features a cantilever wing and horizontal tail, whose upper surfaces support 236 sq ft of solar cells that are rated at 13% conversion efficiency. The main wing spar and fuselage boom are constructed by wrapping a carbon fiber tube with 1/4-in.-thick Nomex honeycomb, followed by two layers of Kevlar cloth. Flutter tests of the airframe have been conducted at speeds of up to 65 mph by mounting the tail, fin and wing on a van. The aircraft is designed for 100-mile flights at 5000-10,000 ft altitudes and 25-35 mph, but the nearly horizontal mounting of the solar cells restricts flight conditions to those with high sun angles, at midday. When the sun is low in the sky, as in winter, the Solar Challenger must fly due north to maximize insolation. O.C.

A82-12896 # **Helicopter icing spray system - Improvements and flight experience.** D. Belte (U.S. Army, Edwards AFB, CA). *(Canadian Aeronautics and Space Institute, Flight Test Symposium, Medley, Alberta, Canada, Mar. 31, Apr. 1, 1981.) Canadian Aeronautics and Space Journal*, vol. 27, 2nd Quarter, 1981, p. 93-106. 6 refs.

In 1979 improvements were made to the helicopter icing spray system used in icing qualification tests. The improvements were aimed at reducing drop diameter and eliminating ice formation on the spray boom. A Sonicore nozzle was selected to replace the original atomizers and the number of atomizers on the spray boom was tripled. The newly modified configuration was evaluated using a UH-1H helicopter. Measurements were made of drop size distribution and liquid water content. Spray cloud measurements showed great improvement over earlier characteristics, and the median volumetric diameter approached that of natural clouds. The types of ice formation also reflected the improvement in cloud quality. Since in-flight spray simulation cannot duplicate the 100% relative humidity of a natural icing cloud, a computer program was developed to define the evaporation effect on liquid water content. An expanded airspeed range was used for 1980-1981 tests and results were compiled for the UH-60A, UH-1H ice phobics, Bell Model 412 and Grumman OV-1D. S.C.S.

A82-12897 # **Fractographic determination of fatigue crack growth rates in aircraft components.** W. Wiebe and R. V. Dainty (National Aeronautical Establishment, Structures and Materials Laboratory, Ottawa, Canada). *(Canadian Aeronautics and Space Institute, Annual General Meeting, Montreal, Canada, May 11, 12, 1981.) Canadian Aeronautics and Space Journal*, vol. 27, 2nd Quarter, 1981, p. 107-117.

The application of electron fractography to the failure analysis of aircraft components is considered to be rewarding because it frequently permits the precise identification of the causes of component failure. Quantitatively, considerable effort has been devoted to the development of techniques specifically directed to the evaluation of fatigue crack growth rate information, both from service fatigue failures, and from components fractured during full-scale aircraft laboratory fatigue tests. Originally, the fractographic determination of crack growth rate data in these laboratory tests was relatively straightforward, since discrete numbers of load cycles were applied at each of the various load levels in the fatigue loading spectrum. However, recent use of computer-controlled random fatigue loading equipment has produced new problems associated with the identification and correlation of the randomly spaced fatigue striations on the fracture surface, and the derivation of crack growth rate data from them. The fractographic methods developed for the solution of these problems are described. (Author)

A82-12698 # **SARSAT applications.** W. R. McPherson (Defence Research Establishment, Ottawa, Canada). *(Canadian Aeronautics and Space Institute, Canadian Conference on Astronautics, 1st, Ottawa, Canada, Oct. 20-22, 1980.) Canadian Aeronautics and Space Journal,* vol. 27, 2nd Quarter, 1981, p. 118-126.

The SARSAT system is designed to utilize satellite technology for the rapid detection and location of marine and air distress incidents. The system consists of (1) emergency beacons for small aircraft and boats operating at 406 MHz; (2) space components including on-board receivers and processors; and (3) a ground receiving station with related communication links. The system is expected to detect an emergency beacon within six hours of its activation with local accuracy to the order of 20 km at present, and 5 km or better for the 406 MHz test units. The first SAR instrumented spacecraft will be launched in mid-1982. Five countries are presently involved in the project, including the USSR COSPAS/-SARSAT project and the SARSAT Investigator in Norway. S.C.S.

A82-12775 **F-5G Tigershark.** D. Richardson. *Flight International,* vol. 120, Oct. 17, 1981, p. 1144-1150.

Design features, production goals, and potential markets for the F-5G fighter are reviewed. The aircraft was developed as a counter to the MiG-23 and third generation MiG-21. A GE F404 turbofan engine was chosen, with space left in the redesigned fuselage to accommodate minor engine improvements. A Mach 2 top speed is noted, and an 8,000 hr service life with a 9 g limiting load is projected; fuel consumption is lower than in the F5-E, with more available thrust. Design changes affected the rear fuselage profile, added a carbon composite tailplane, spar, and vertical fin, thicker wing skins to withstand 9 g combat maneuvers, and a larger canopy for greater visibility, in addition to instrument console flexibility. Armament options are provided, with mounts capable of using non-US ordnance; performance characteristics, including the 16,400 lb thrust are given, along with estimated selling price and production schedules. Over 90% of the ground support equipment of the F5-E is mentioned as being compatible with the F-5G. M.S.K.

A82-12801 # **The case for a defensive air-to-air fighter.** W. Hill, Jr. (Rockwell International Corp., North American Aircraft Div., Los Angeles, CA). *Astronautics and Aeronautics,* vol. 19, Nov. 1981, p. 28-36.

An investigation is conducted regarding the approaches available to compensate for the imbalance of tactical air power which favors the Soviets/Warsaw Pact over the U.S./NATO forces, taking into account the constraints of the U.S. Air Force budget. One approach can be to increase the fighter procurement monies, by reducing other budget items, to buy large quantities of the expensive multimission fighter. However, in connection with budgetary considerations related to the urgency of other requirements, it appears that new aircraft the size and capability of the F-15 and F-16 cannot be obtained in quantities sufficient to gain parity with Soviet air forces. It is, therefore, proposed to employ a single-mission aircraft which, because of its simple design and low cost, can be built in quantity. This proposal is based on the recognition that an effective NATO interceptor does not need all the capabilities of the F-15 and F-16. G.R.

A82-12803 * # **Solution to the hidden-line problem.** D. R. Hedgley (NASA, Flight Research Center, Edwards AFB, CA). *Astronautics and Aeronautics,* vol. 19, Nov. 1981, p. 51.

It is pointed out that realistic three-dimensional renderings of solid objects or surfaces by computers have long been needed. The NASA Dryden Flight Research Center will soon publish a report and the computer program on an algorithm that solves for hidden lines. The computer program is written in FORTRAN IV and its size is approximately 35N + 9500 words, where N is the number of elements. A number of pictures are presented which were drawn by a computer using the algorithm. G.R.

A82-12804 # **Parachute technology under pressure.** E. A. Reed (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). *Astronautics and Aeronautics,* vol. 19, Nov. 1981, p. 56-61. 22 refs.

A description is presented of advances in specific areas of parachute technology, taking into account developments occurring since 1975. It is pointed out that stress and parachute design analysis continue to have the same needs as in 1975. Some analytic work has related nonlinear elasticity, energy dissipation and textile weave to the propagation of step strain pulses due to snatch or impact loadings. Sophisticated computer programs exist for stress analysis of parachutes and for calculating their opening load. Attention is given to the improved performance of new textile materials, possibilities for improvements related to supersonic parachutes, aspects of parachute packing, and developments concerning ejection seats. G.R.

MATHEMATICAL MODEL FOR THE MAINTENANCE PROGRAM OF MODERN JET AIRCRAFT

Rudolf Prinz, Hans-Christian Goetting, Karl-Heinz Galda (Deutsche Lufthansa A.G., Hamburg), and Juergen Kreth (Deutsche Lufthansa A.G., Hamburg) Oct. 1980 44 p refs In GERMAN; ENGLISH summary Report will also be announced as Translatation (ESA-TT-724)
(DFVLR-FB-81-14) Avail: NTIS HC A03/MF A01; DFVLR, Cologne DM 10,40

Step-by-step escalation of structural inspection intervals based on long-term experience with a fleet of transport aircraft is described by a mathematical model. Fundamental to the model are statistical distributions of load and detectable crack length in a fatigue loaded component. Knowing realistic probabilities of failure enables the calculation of appropriate inspection intervals. Calculation procedure yields increasing intervals up to a maximum value and a decrease when approximating the mean value of detectable crack length. As to usual interval steps, the results show good agreement with practice. Restrictions and possible applications of the model are discussed. Author (ESA)

STANDARD TESTS OF A RESEARCH MODEL ROTOR IN A WIND TUNNEL, INCLUDING MODEL SIMILARITY [STANDARD-ERPROBUNG DES FORSCHUNGS-MODELLROTORS IM WINDKANAL, EINSCHLIESSLICH MODELLVERGLEICHEN]

R. Stricker, V. Mikulla, and E. Allramseder Bonn Bundesministerium der Verteidigung 1979 93 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium der Verteidigung (BMVg-FBWT-79-16) Avail: NTIS HC A05/MF A01; Dokzentbw, Bonn DM 30

A wind tunnel test program was developed, as a basis the actual flight regime of the BO-105 helicopter. Operation of the test stand and calibration of measuring devices is described. The procedure for data reduction (digital programs) is given. Results include the parameters: mean and fluctuating components of rotor forces and moments; blade bending moments (flapping, lagging); and control forces. Control and static stability derivatives are also determined. The calculations done for comparison with measurements, using aerodynamic/aeroelastic/flight mechanic digital programs, show in almost all cases very good agreement with model test results. The correlation with flight test data of the BO-105 helicopter shows that model similarity according to the most important scaling laws is fulfilled to a high degree and that the results can be used for real comparison of various sizes of hingeless helicopter rotors. EXPERIMENTAL INVESTIGATIONS OF THE SEPARATED FLOW AROUND A RECTANGULAR WING

Hans Bippes, Michael Turk, and Klaus Jacob Oct. 1980 56 p refs In GERMAN; ENGLISH summary
(DFVLR-FB-81-12) Avail: NTIS HC A04/MF A01; DFVLR, Cologne DM 10

For the aspect ratios lambda = 3.1 and 2.3, pressure distributions over the whole span were measured at angles of attack up to alpha approximately = 27 deg. For selected cases, oil flow patterns were produced and velocity profiles behind the wing along with shear stresses at the surface were measured. Most of the model and the experiments were carried out at Re approximately = 2,100,000 and M approximately = 0.17. The model and the experiments are described. The results are discussed and partly compared with results from a theoretical model. Author (ESA)

AIRCRAFT EXCRESCENCE DRAG

A. D. Young, J. H. Paterson, and J. Lloyd Jones, ed. Jul. 1981 172 p refs
(AGARD-AG-264; ISBN-92-835-1382-4) Avail: NTIS HC A08/MF A01

A review was undertaken of the available data on the subject of the drag of excrescences on aircraft surfaces. Information from this review is summarized and presented in a way that is readily usable for prediction and design purposes. The basic characteristics of boundary layers are discussed and, where possible, the drag of excrescences is related to those characteristics. In particular, because the size of many types of surface imperfection is small in comparison with boundary layer thicknesses, the drag of such imperfections can be correlated in terms of the properties of inner regions of the boundary layer. Several previously published analyses of this type are highlighted and, where possible, extensions to other data sources or other types of excrescence are presented. The practical problems of applying these data in the varying velocity gradients existing on aircraft surface are treated and one section is devoted to the drag of auxiliary air inlet and exit openings. Gaps in existing data which offer opportunities for research effort are pointed out. J.M.S.

ICING TUNNEL TEST OF A GLYCOL-EXUDING POROUS LEADING EDGE ICE PROTECTION SYSTEM ON A GENERAL AVIATION AIRFOIL Final Report

David L. Kohlman, William G. Schweikhard, and Alan E. Albright Sep. 1981 37 p refs
(Grant NAG3-71)
(NASA-CR-165444; KU-FRL-464-1) Avail: NTIS HC A03/MF A01 CSCL 01C

Test results show that the system is very effective in preventing ice accretion (anti-ice mode) or removing ice from an airfoil. Minimum glycol flow rates required for antiicing are a function of velocity, liquid water content in the air, ambient temperature, and droplet size. Large ice caps were removed in only a few minutes using anti-ice flow rates, with the shed time being a function of the type of ice, size of the ice cap, angle of attack, and glycol flow rate. Wakc surveys measurements show that no significant drag penalty is associated with the installation or operation of the system tested. T.M.

SPIN RECOVERY TRAINING

Washington GPO 1980 15 p Presented by the Subcomm. on Invest. and Oversight of the Comm. on Sci. and Technol., 96th Congr., 2nd Sess., Jul. 1980
(GPO-66-020) Avail: Subcommittee on Investigations and Oversight

The FAA policy of not requiring spin recovery training as a prerequisite for a private pilot license was examined in an effort to determine if such a requirement would result in a net savings of life. Only FAA remained adamant in defense of the no-spin training policy. All other witnesses, to varying degrees, expressed the need for spin and recovery training as a common sense safety requirement. It can be concluded without equivocation that experienced aviators overwhelmingly demand that aspiring pilots be trained to protect themselves and be able to recover from post stall gyrations, incipient spins, and spins. The subcommittee's recommondations that such training be required for licensing is discussed with emphasis on the development of a flight training manual and an implementation plan. A.R.H.

A PROPOSED FLIGHT SAFETY PROGRAM FOR THE KOREAN AIR FORCE M.S. Thesis

Chong Kwan Lee Mar. 1981 136 p refs
(AD-A102373) Avail: NTIS HC A07/MF A01 CSCL 05/1

Several methodologies relevant to the development of a safety program for the Korean Air Force were reviewed. Methodologies considered included: Control charts; System safety analysis; and

Critical incident technique. Data collection methods applicable to accident analysis were proposed. Recommendations for the incorporation of these methods into a safety program for the K.A.F. were developed. The safety program described in this thesis possesses the potential for reducing overall operational costs and maximizing aircraft availability. The end result of such a program can only serve to increase operational readiness and thereby maximize overall efficiency and military capability of the K.A.F. GRA

COST REDUCTION IN AIR TRANSPORTATION
P. Lebouc 1980 21 p Presented at French Aerospace Week, Indonesia, 8-12 Dec. 1980
(SNIAS-811-150-101) Avail: NTIS HC A02/MF A01

Historical trends in costs are reviewed. By adopting fuel conservation policies, such as renewal of the jet fleet, adaptation of flight operation, and modification of air traffic control procedures, the airlines can limit the effect of expected fuel price increases. In parallel, productivity gains should keep at a constant level all the other costs of airline operations. Under the above conditions, growth of the industry seems to be certain even if fuel prices increase at a rate of 2 to 4% per year above inflation during the next 20 years. Author (ESA)

DEVELOPMENT AND CONSTRUCTION OF PILOT EJECTOR SEATS IN GERMANY FROM 1938-1945
Siegfried Ruff Feb. 1981 110 p refs In GERMAN; ENGLISH summary
(DFVLR-FB-81-04) Avail: NTIS HC A06/MF A01; DFVLR, Cologne DM 26

Pioneering research, leading to the development of an ejector seat for the Junkers Ju 88, is reviewed. Fundamentals in establishing human acceleration tolerances are discussed. The experimental simulation of shock induced acceleration is described, and human resistance is quantified. Exploitation and follow-up of accident related data are summarized, including investigations of the accelerations experienced with an aircraft out of control, e.g., shot down. The action of airspeed pressure on a person is considered, and experience gained with research aircraft is recounted. Measuring methods for technical and physiological parameters are indicated. The beginning of ejector seat development in England, Sweden, and the U.S. (1944-45) is also briefly reviewed in comparison. Author (ESA)

The statistical theory of radio direction finding as it applied to three-dimensional geometrics is presented in this report. This theory is an extension of the two-dimensional theory presented by R. G. Stansfield in 1947. The theory has application in situations where airborne targets are maneuvering in three dimensions at high speed, especially when the platforms with the direction finding equipment are also aircraft. EXPERIMENTAL MODAL ANALYSIS OF THE FUSELAGE PANELS OF AN AERO COMMANDER AIRCRAFT Final Report
David Geisler Sep. 1981 164 p refs Prepared in cooperation with Structural Dynamics Res. Corp., Cincinnati, Ohio
(Contract NAS1-14693)
(NASA-CR-165750; Rept-10568) Avail: NTIS HC A08/MF A01 CSCL 01C

The reduction of interior noise in light aircraft was investigated with emphasis the thin fuselage sidewall. The approach used is theoretical and involves modeling of the sidewall panels and stiffeners. Experimental data obtained from tests investigating the effects of mass and stiffness treatments to the sidewalls are presented. The dynamic characteristics of treated panels are contrasted with the untreated sidewall panels using experimental modal analysis techniques. The results include the natural frequencies, modal damping, and mode shapes of selected panels. Frequency response functions, data relating to the global fuselage response, and acoustic response are also presented. J.M.S.

V/STOL AIRCRAFT AND FLUID DYNAMICS
Leonard Roberts (Stanford Univ., Calif.) and Seth B. Anderson Oct. 1981 8 p refs
(NASA-TM-81328; A-8730) Avail: NTIS HC A02/MF A01 CSCL 01C

The impact of military applications on rotorcraft and V/STOL aircraft design is summarized with respect to fixed-wing aircraft. The influence of the mission needs on the configurational design of V/STOL aircraft, the implications regarding some problems in fluid dynamics relating to propulsive flows, and their interaction with the aircraft and the ground plane, are also considered. Additional research in fluid dynamics that can contribute to an improvement in performance of V/STOL aircraft is suggested. B.W.

AN INVESTIGATION OF A STOPPABLE HELICOPTER ROTOR WITH CIRCULATION CONTROL
John D. Ballard, John L. McCloud, III, and T. J. Forsyth Aug. 1980 372 p refs
(NASA-TM-81218; A-8278) Avail: NTIS HC A16/MF A01 CSCL 01C

A stoppable helicopter rotor with circulation control was investigated in the Ames 40 by 80 foot wind tunnel. The model was tested as a rotating wing, a fixed wing, and during transition start/stop sequences. The capability of the model's control system to maintain pitch and roll moment balance during the start/stop sequence, the ability of the blades to withstand the start/stop loads, the adequacy of the control system to maintain balance in the helicopter mode, and the control system capabilities in the fixed-wind mode were assessed. Time-history data of several start/stop sequences of the X-wing rotor, and the steady-state data relating to the model as both a rotor and as a fixed-wing aircraft are presented. In addition, stability data are presented which were acquired during open-loop and closed-loop tests of the hub moment feedback control system. J.M.S.

QUIET SHORT-HAUL RESEARCH AIRCRAFT FAMILIARIZATION DOCUMENT, REVISION 1
Joseph C. Eppel Sep. 1981 81 p refs
(NASA-TM-81298; A-8801) Avail: NTIS HC A05/MF A01 CSCL 01C

The design features and general characteristics of the Quiet Short Haul Research Aircraft are described. Aerodynamic characteristics and performance are discussed based on predictions and early flight test data. Principle airplane systems, including the airborne data acquisition system, are also described. The aircraft was designd and built to fulfill the need for a national research facility to explore the use of upper surface blowing, propulsive lift technology in providing short takeoff and landing capability, and perform advanced experiments in various technical disciplines such as aerodynamics, propulsion, stability and control, handling qualities, avionics and flight control systems, trailing vortex phenomena, acoustics, structure and loads, operating systems, human factors, and airworthiness/certification criteria. An unusually austere approach using experimental shop practices resulted in a low cost and high research capability. Author

The development of a digital, three dimensional, automatic control law designed to achieve an optimal transition of a B-737 aircraft between glide slope conditions and the desired final touchdown condition is presented. The digital control law is a time invariant, state estimate feedback law, and the design is capable of using the microwave landing system. Major emphasis is placed on the reduction of aircraft noise in communities surroundings airports, the reduction of fuel consumption, the reduction of the effects of adverse weather conditions on aircraft operations, and the efficient use of airspace in congested terminal areas. Attention is also given to the development of the capability to perform automatic flares from steep glide slopes to precise touchdown locations. B.W.

This report presents the results of a program to develop a low maintenance accumulator, compatible with current MS envelopes and competitive in cost with conventional accumulators. The purpose of the program was to select and develop a metal bellows configuration/concept to replace the conventional moving piston and seal of conventional accumulators. The selected bellows are of welded construction and welded in place to allow bellows movement identical to piston movement. The accumulator housing is of welded construction to eliminate all possible leak points. The program goal was to develop an accumulator to provide a ten year unserviced life. Test results indicate an accumulator design is possible to achieve a service life of 6 to 10 years based on installation on an F-16 aircraft. Author (GRA)

A CFRP TAILERON FOR THE TORNADO: CONSTRUCTION AND PRODUCTION [CFK-TAILERON FUER DEN TORNADO: KONSTRUKTION UND FERTIGUNG]
L. Lemmer, W. Hartmann, and R. Guenther 1980 67 p In GERMAN Presented at Gastvortrag im KL 624, Mannheim, West Germany, 10-14 Nov. 1980
(MBB-FE-212/KFK/PUB/2) Avail: NTIS HC A04/MF A01

A CFRP lightweight structure, i.e., CFRP taileron, for the Tornado aircraft was developed. The CFRP taileron is interchangeable with the currently used metal horizontal stabilizer as far as geometry, function and durability are concerned while a 30% weight reduction is achieved with CFRP construction. The assembly of the CFRP taileron is detailed and results from static, dynamic, and vibration testing of the structure are presented. A series production method is then outlined, including inspection and certification procedures. Author (ESA)

THEORETICAL INVESTIGATION OF THE INFLUENCE OF SPOILER DYNAMICS ON THE HANDLING QUALITIES OF AN AIRCRAFT WITH DIRECT LIFT CONTROL
Dieter Schafranek Jul. 1981 66 p refs Transl. into ENGLISH of "Theoretische Untersuchung ueber den Einfluss der Spoilerdynamik auf die Fliegbarkeit eines Flugzeugs mit direkter auftriebssteuerung" Rept. DFVLR-FB-80-07 DFVLR, Brunswick, 1980 Original report in GERMAN previously announced as N81-13975
(ESA-TT-681; DFVLR-FB-80-07) Avail: NTIS HC A04/MF A01; DFVLR, Cologne DM 14,70

Theoretical parameters describing the pilot's workload during aircraft control pitch tracking and flight path tracking tasks on a transport aircraft equipped with spoiler direct lift control (DLC) were studied. The determined parameters are the necessary phase compensation and gain adapation which the pilot must perform, and also the closed loop resonance. The influence of the DLC-gain factor, spoiler actuator rate, and spoiler deflection washout time constant on pilot workload is presented. Simulated time histories of pitch rate and normal acceleration response due to step type control inputs show the corresponding reactions of the various DLC-configurations which are essential for pitch control and flight path control. Direct lift control using spoilers is shown to be sensible for the aircraft in the test only if the pitching moment of the spoiler is completely compensated, the time constant for the spoiler deflection washout is not too small (greater than 5 seconds) and if the spoiler moves with more delay than the elevator. (NASA-CR-165499; DDA-EDR-10470) Avail: NTIS HC A09/MF A01 CSCL 21E

Propulsion requirements were determined for 0.5 and 0.7 Mach aircraft. Sensitivity studies were conducted on both these aircraft to determine parametrically the influence of propulsion characteristics on aircraft size and direct operating cost (DOC). Candidate technology elements and design features were identified and parametric studies conducted to select the STAT advanced engine cycle. Trade off studies were conducted to determine those advanced technologies and design features that would offer a reduction in DOC for operation of the STAT engines. These features were incorporated in the two STAT engines. A benefit assessment was conducted comparing the STAT engines to current technology engines of the same power and to 1985 derivatives of the current technology engines. Research and development programs were recommended as part of an overall technology development plan to ensure that full commercial development of the STAT engines could be initiated in 1988. T.M.

DEVELOPMENT OF LOW MODULUS MATERIAL FOR USE

IN CERAMIC GAS PATH SEAL APPLICATIONS Final Report
H. E. Eaton and R. C. Novak Oct. 1981 83 p refs
(Contract NAS3-22134)
(NASA-CR-165469; R81-915188-13) Avail: NTIS HC A05/MF A01 CSCL 21E

Three candidate materials were examined: Brunsbond (I Pad; plasma sprayed porous NiCrAlY; and plasma sprayed low modulus microcracked zirconia. Evaluation consisted of mechanical, thermophysical, and oxidation resistance testing along with optical microscopy and a feasibility demonstration of attaching the material to a suitable substrate. The goals of the program were the following: feasibility of fastening or depositing the low modulus system onto a broad range of substrate alloys; feasibility of depositing or forming the low modulus system to a thickness of 0.19 cm to 0.38 cm; potential to attain a modulus of elasticity in the range of 3.4 to 6.9 GPa (0.5 to 1.0 MSI), and an ultimate strength of 17.2 MPa (2.5 ksi); suitable thermal conductivity; and static oxidation life of at least 1000 hours at 1311 K. The results of the program indicate that all three systems offer attractive properties as a strain isolator material. T.M.

THERMAL-BARRIER-COATED TURBINE BLADE STUDY Final Report
P. A. Siemers and W. B. Hillig Aug. 1981 134 p refs
(Contract NAS3-21727)
(NASA-CR-165351; SRD-81-063) Avail: NTIS HC A07/MF A01 CSCL 21E

The effects of coating TBC on a CF6-50 stage 2 high-pressure turbine blade were analyzed with respect to changes in the mean bulk temperature, cooling air requirements, and high-cycle fatigue. Localized spallation was found to have a possible deleterious effect on low-cycle fatigue life. New blade design concepts were developed to take optimum advantage of TBCs. Process and material development work and rig evaluations were undertaken which identified the most promising combination as ZrO2 containing 8 w/o Y2O3 applied by air plasma spray onto a Ni22Cr-10Al-1Y bond layer. The bond layer was applied by a low-pressure, high-velocity plasma spray process onto the base alloy. During the initial startup cycles the blades experienced localized leading edge spallation caused by foreign objects. T.M.

DETERMINATION OF AIRPLANE MODEL STRUCTURE FROM FLIGHT DATA BY USING MODIFIED STEPWISE REGRESSION
Vladislav Klein (Joint Inst. for Advancement of Flight Sciences, Hampton, Va.), James G. Batterson, and Patrick C. Murphy Oct. 1981 48 p refs
(NASA-TP-1916; L-14613) Avail: NTIS HC A03/MF A01 CSCL 01C

The linear and stepwise regressions are briefly introduced, then the problem of determining airplane model structure is addressed. The MSR was constructed to force a linear model for the aerodynamic coefficient first, then add significant nonlinear terms and delete nonsignificant terms from the model. In addition to the statistical criteria in the stepwise regression, the prediction sum of squares (PRESS) criterion and the analysis of residuals were examined for the selection of an adequate model. The procedure is used in examples with simulated and real flight data. It is shown that the MSR performs better than the ordinary stepwise regression and that the technique can also be applied to the large amplitude maneuvers. T.M.

DEVELOPMENT AND EVALUATION OF AUTOMATIC LANDING CONTROL LAWS FOR LIGHT WING LOADING STOL AIRCRAFT
B. Feinreich, O. Degani, and G. Gevaert Jul. 1981 371 p refs
(Contract NAS2-9410)
(NASA-CR-166160) Avail: NTIS HC A16/MF A01 CSCL 01C

Automatic flare and decrab control laws were developed for NASA's experimental Twin Otter. This light wing loading STOL aircraft was equipped with direct lift control (DLC) wing spoilers to enhance flight path control. Automatic landing control laws that made use of the spoilers were developed, evaluated in a simulation and the results compared with these obtained for configurations that did not use DLC. The spoilers produced a significant improvement in performance. A simulation that could be operated faster than real time in order to provide statistical landing data for a large number of landings over a wide spectrum of disturbances in a short time was constructed and used in the evaluation and refinement of control law configurations. A longitudinal control law that had been previously developed and evaluated in flight was also simulated and its performance compared with that of the control laws developed. Runway alignment control laws were also defined, evaluated, and refined to result in a final recommended configuration. Good landing performance, compatible with Category 3 operation into STOL runways, was obtained. Author

Apr. 1980

(ESA-TT-679; DFVLR-Mitt-80-05) Avail: NTIS HC A03/MF A01; DFVLR, Cologne DM 8.30

The dynamic behavior of a parachute-load system moving in a plane is analyzed. A mathematical model is adopted and a system of nonlinear equations of motion is produced, which are then solved without linearization using a digital computer. Calculations are carried out using a modified guide surface parachute in order to investigate the effects of parachute size, distance between attachment point and canopy, and distance between the attachment point and the center of gravity of the load on the oscillation of the missile. Parameters influencing the variation of the pitch angle of the load with time are also studied. Increasing the canopy and moving the attachment point behind the center of gravity of the load results in better stabilization. The damping increases, i.e. the pitch angle of the load becomes smaller and the period of oscillation decreases. If the distance between the attachment point on the load and the center of the canopy base is varied, there is scarcely any detectable change to the period of oscillation. However, the damping is influenced by a change in this distance; it has a maximum when the distance is approximately that which is customarily used. Author (ESA)

A METHOD FOR DETERMINATION OF THE AEROELASTIC BEHAVIOR OF AIRCRAFT WITH ACTIVE CONTROL SYSTEMS Ph.D. Thesis - Tech. Univ. Carolo-Wilhelmina

Raymond Freymann Feb. 1981 128 p refs In GERMAN; ENGLISH summary Report will also be announced as translation (ESA-TT-719)
(DFVLR-FB-81-05) Avail: NTIS HC A07/MF A01; DFVLR, Cologne DM 26,30

An analytical method for the performance of dynamic calculations on servocontrolled aircraft, based on an extended formulation of the generalized aeroelastic equations is presented. The additional parameters introduced in the extended equations of motion are determined experimentally in a ground vibration test performed on a real aircraft structure as well as with help from an experimental-analytical method for determination of the transfer functions of the hydraulic actuators. The elaborated method is shown satisfactory by comparison of measured and calculated data resulting from investigations performed on a model wing structure with a rudder driven by a hydraulic actuator.

THE NEED FOR MULTIVARIABLE DESIGN AND ANALYSIS TECHNIQUES

Rhall E. Pope *In* AGARD Multi-Variable Analysis and Design Tech. Sep. 1981 10 p

Avail: NTIS HC A08/MF A01

Demand for higher accuracy, improved reliability/survivability, and more automation are placing increased emphasis on the control function for successful operation of aircraft weapon systems. Modifications to airframe designs directed at increased maneuverability and reduced weight are placing stringent on flight control systems. Fly-by-wire systems, particularly digital systems, provide the flexibility to not only accommodate but influence airframe design modifications and led to the control configured vehicle (CCV) concept. These advances in air, vehicle design and flight control system implementation are overwhelming traditional design and analysis techniques. Stability and control design specification are inadequate in dealing with statistically unstable vehicles, multiple control loops and high dynamic coupling. Better control system design and analysis techniques are needed which address the multi-input closely coupled dynamic nature of today's and tomorrows aircraft weapon systems.

CHARACTERISTIC AND PRINCIPAL GAINS AND PHASES AND THEIR USE AS MULTIVARIABLE CONTROL DESIGN TOOLS

Alistair G. J. MacFarlane *In* AGARD Multi-Variable Analysis and Design Tech. Sep. 1981 34 p refs

Avail: NTIS HC A08/MF A01

The key to the generalization of classical frequency-response design techniques to the multivariable case lies in the development of ways of suitably extending the concepts of gain and phase. It is shown how algebraic function theory can be used to generalise Nyquist diagram and Root-Locus diagram techniques for use with systems having many inputs and outputs. This is done in such a way that the main structural features of such diagrams can be related to state-space model parameters. The shortcomings of characteristic gains and phases (used in a generalised Nyquist approach) are then noted. An alternative way of introducing amplitude and phase information, via the polar decomposition of an operator, leads to the introduction of principal gains and principal phases. Their properties are examined and, in particular, it is shown how they may be used to characterise robustness. The use of these techniques for design purposes is discussed.

MULTIVARIABLE DESIGN TECHNIQUES BASED ON SINGULAR VALUE GENERALIZATIONS OF CLASSICAL CONTROL

John C. Doyle *In* AGARD Multi-Variable Analysis and Design Tech. Sep. 1981 15 p refs

Avail: NTIS HC A08/MF A01

Singular value analysis was used to generalize the fundamental feedback ideas from classical single loop control theory to multiloop systems. The classical view of measuring the benefit of feedback in terms of desensitizing the system to plant variations and disturbances is discussed. Uncertainty is shown to play a critical role in determining the way in which feedback may be used. Certain singular value plots, called sigma-plots, are introduced as natural and effective generalizations of Bode gain plots and form the basic tools for analysis of multiloop feedback systems. These tools provide reliable means for assessing the stability margins, bandwidth, and desensitizing effects of multiloop feedback systems. Examples of a two input oscillator and control of the rotors of the CH-47 helicopter are given to illustrate the use of the sigma-plots and their interpretations. A.R.H.

LIMITATIONS ON ACHIEVABLE PERFORMANCE OF MULTIVARIABLE FEEDBACK SYSTEMS

John C. Doyle *In* AGARD Multi-Variable Analysis and Design Tech. Sep. 1981 9 p refs

Avail: NTIS HC A08/MF A01

The design tradeoffs that are the focus of classical single-loop theory were generalized to multiloop systems using singular value analysis techniques. The first tradeoff is algebraic between large loop gain for good sensitivity properties and small loop gain for stability margins. Another is the functional tradeoff improsed by the Bode gain/phase relations. These tradeoffs impose limitations on the achievable performance of any feedback design. The limitations caused by nonminimum phase zeros are also discussed. The problem of directionality in multiloop systems has no analog in single loop feedback systems is presented and analyzed.

MULTIVARIABLES DESIGN: THE OPTIMIZATION OF APPROXIMATE INVERSES

G. Zames *In* AGARD Multi-Variable Analysis and Design Tech. Sep. 1981 6 p refs

Avail: NTIS HC A08/MF A01

A mathematical framework for the analysis of sensitivity in multi-input-multi-output linear feedback systems is proposed, based on the concepts of a multiplicative seminorm and an approximate inverse. Many of the empirical results of classical control theory pertaining to the use of lead-lag networks can be deduced in this framework as solutions to well-posed mathematical optimization problems. Moreover, new classes of optimal filters for the reduction of sensitivity are introduced. A definition of optimal sensitivity to plant uncertainty is established. The multiplicative property of seminorms is used to obtain the following principle: for any specified aposteriori accuracy, there is a maximum of apriori plant uncertainty that can be tolerated, and a minimum of identification that is required. FEEDBACK AND MINIMAX SENSITIVITY

George Zames and Bruce A. Francis (Waterloo Univ.) *In* AGARD Multi-Variable Analysis and Design Tech. Sep. 1981 8 p refs Sponsored in part by National Science and Engineering Research Council of Canada

(Grant NSF ECS-80-12-565)

Avail: NTIS HC A08/MF A01

Feedbacks that minimize the sensitivity function of a linear, single variable feedback system represented by its frequency responses were considered. Sensitivity is measured in a weighted H (infinity) norm. The single variable cases are studied. The results are extended to unstable plants, and explicit formulas for the general situation of a finite number of RHP plant zeros or poles are provided. The Q or 'approximate-inverse' parameterization of feedbacks that maintain closed-loop stability is extended to the case of unstable plants. The H (infinity) and Wiener-Hopf approaches are compared. EVALUATION OF THE ACOUSTIC MEASUREMENT CAPABILITY OF THE NASA LANGLEY V/STOL WIND TUNNEL OPEN TEST SECTION WITH ACOUSTICALLY ABSORBENT CEILING AND FLOOR TREATMENTS Final Report

Mark A. Theobald May 1978 46 p refs

(Contract NAS1-14611)

(NASA-CR-165796; Rept-3820) Avail: NTIS HC A03/MF A01 CSCL 14B

The single source location used for helicopter model studies was utilized in a study to determine the distances and directions upstream of the model accurate at which measurements of the direct acoustic field could be obtained. The method used was to measure the decrease of sound pressure levels with distance from a noise source and thereby determine the Hall radius as a function of frequency and direction. Test arrangements and procedures are described. Graphs show the normalized sound pressure level versus distance curves for the glass fiber floor treatment and for the foam floor treatment. A.R.H.

AIR-BREATHING ENGINE TEST FACILITIES REGISTER

Joachim H. Krengel, comp. Jul. 1981 122 p

(AGARD-AG-269) Avail: NTIS HC A06/MF A01

A register was compiled, aimed at comprising the test facilities relevant for research and development in NATO countries. Included are test facilities being in use or under construction at the various research organizations, industrial firms, and universities. Test facilities and their technical data are given as far as the response to a questionnaire was received or open literature was available. Test engineers will be able to find whether a test facility suiting their specific demands already exists or may be easily adapted to their purposes. T.M.

FLIGHT TEST RESULTS OF THE MODEL SIMULATION CONTROLLER FOR THE HFB 320 FOR IN-FLIGHT SIMULATION OF THE A310 AIRBUS

Hans-Heinz Lange Apr. 1981 72 p refs Transl. into ENGLISH of 'Flugerprobung des modellfolgereglers fuer die HFB 320 zur Simulation des Airbus A 310 in Fluge" Rept. DFVLR-Mitt-79-13

DFVLR, Brunswick, 1979 Original report in GERMAN previously announced as N81-10078
(ESA-TT-660; DFVLR-Mitt-79-13) Avail: NTIS HC A04/MF A01; DFVLR, Cologne DM 15,40

The onboard computer program which completes the model simulating control system is presented and its fundamental operations explained. The effect of nonlinearities is demonstrated by means of the results of ground simulation of the test aircraft, the control system and the simulated aircraft. The flight test results show the achieved quality of in-flight simulation of the modeled A310 aircraft. Examples of the ground simulation predictions of the overall aircraft and controller system behavior are cited. Author (ESA)

BASELINE DATA ON UTILIZATION OF LOW-GRADE FUELS IN GAS TURBINE APPLICATIONS. VOLUME 3: EMISSIONS EVALUATION Final Report
T. Sonnichsen Jun. 1981 106 p refs Sponsored in part by Electric Power Research Inst.
(EPRI Proj. 1079-3)
(DE81-903764; EPRI-AP-1882-Vol-3) Avail: NTIS HC A06/MF A01

A series of field tests was conducted on two residual-oil-fired gas turbine/heat recovery steam generators (HRSG) comprising a Westinghouse PACE 260-MW combined-cycle unit. Base load emission levels were determined. A series of tests was also made at reduced operating loads. Emission measurements included: (1) gaseous constituents measured by continuous monitoring instrumentation (O2, CO2, NO, NO sub x, and SO2) and by wet chemistry methods (SO3, aldehydes, and chlorides); and (2) particulate characteristics (mass loding, smoke spot number; submicron particle size, and particle morphology). Corrected NO sub x emissions at base load were 170 ppM and 200 ppM with and without HRSG afterburners in service, respectively. The NO sub x emissions decreased with water injection by 50% and were unchanged with the turbine wash. The NO sub x increased with load. DOE

Goldstein (JPL, California Inst. of Technology, Pasadena), and Thomas C. Bickler, inventors (to NASA) (JPL, California Inst. of Technology, Pasadena) Filed 17 Jul. 1981 15 p
(Contract NAS7-100)
(NASA-Case-NPO-15024-1; US-Patent-Appl-SN-284287) Avail: NTIS HC A02/MF A01 CSCL 17I

A simulator for simulating the radar return, or echo, from a target seen by a SAR antenna mounted on a platform moving with respect to the target is described. It includes a first-in first-out memory which has digital information clocked in at a rate related to the frequency of a transmitted radar signal and digital information clocked out with a fixed delay defining range between the SAR and the simulated target, and at a rate related to the frequency of the return signal. An RF input signal having a frequency similar to that utilized by a synthetic aperture array radar is mixed with a local oscillator signal to provide a first baseband signal to provide a first baseband signal having a frequency considerably lower then that of the RF input signal. In Task 1, the requirements for the electrical power system and the integrated power system control were defined. In Task 2, three conceptual designs for the electrical power system were prepared. Each design incorporated a different data bus architecture, integrated, hierarchical, and non-integrated dedicated. The three designs were evaluated for application to a two engine tactical aircraft. Processor and data bus loading were examined for each architecture. Based on the evaluation, the conceptual design based on the integrated architecture is recommended for preliminary design in Task 3, phase I. Author (GRA)

CALCULATION OF NATURAL MODES OF VIBRATION FOR ROTOR BLADES BY THE FINITE ELEMENT METHOD
Fritz Kiessling and Dieter Ludwig Jan. 1981 66 p refs In GERMAN; ENGLISH summary
(DFVLR-FB-81-07) Avail: NTIS HC A04/MF A01; DFVLR, Cologne DM 14,20

The mass and stiffness matrices for a rotating blade are established by the finite element method. The formulation is based on the Lagrange function presented for combined flapwise bending, chordwise bending, and torsion of twisted nonuniform rotor blades. The element matrices were created by the nonnumeric computer program REDUCE by which it is possible to evaluate the formulas by symbolic manipulation. An ordering scheme was introduced to demonstrate which terms were simplified or neglected. As examples, eigenanalyses are performed for a nonrotating homogeneous beam and for the rotor blade of a wind energy converter. Author (ESA)

A COMPREHENSIVE BIBLIOGRAPHY OF LITERATURE ON HELICOPTER NOISE TECHNOLOGY Final Report
A. M. Carter, Jr. Jun. 1981 116 p
(Contract DTFA01-80-Y-10597)
(AD-A103331; FAA-EE-81-4) Avail: NTIS HC A06/MF A01 CSCL 20/1

This bibliography, covering the period 1975 through calendar 1980 also provides abstracts on literature that appear to make a significant contribution to the field of helicopter noise technology. The helicopter is recognized as a complex noise generator, with significant contributions from the rotors, the engine and the gearbox. Progress continues to be made in the noise areas of: (a) Formulations, math models and analytical procedures; (b) Noise prediction methodology; (c) Noise reduction techniques; and (d) Subjective response to helicopter noise. The body of information, data and knowledge has use in many applications, including the reduction of helicopter noise in a cost effective manner and in minimizing annoyance to the civil populace. FINITE DIFFERENCE COMPUTATION OF THE STEADY TRANSONIC POTENTIAL FLOW AROUND AIRPLANES

Luo Shijun, Zheng Yuwen, Qian Hong, and Wang Dieqian *In its* Recent Selected Papers of NW Polytech. Univ., pt. 1 (FTD-ID(RS)T-0259-81-Pt-1) 20 Aug. 1981 p 5-30 refs Transl. into ENGLISH from Recent Selected Papers of NW Polytech. Univ., pt. 1 (Xian Shaanxi), 1979

Avail: NTIS HC A17/MF A01

The velocity potential equation was approximated by assuming that the perturbation velocity component in the transverse plane of the body is much smaller than the undistributed flow velocity, while the perturbation velocity component in the longitudinal direction may not be so. It was then solved with mixed schemes of finite differences. The boundary condition on wings (tails) and its wake were approximated similarly. Two numerical examples are included and the results agree well with known wind tunnel test results. T.M.

AN AERODYNAMIC DESIGN METHOD FOR TRANSONIC AXIAL FLOW COMPRESSOR STAGE

Zhu Fangynan, Zhou Xinhai, Liu Songling, and Fan Feida *In its* Recent Selected Papers of NW Polytech. Univ., pt. 1 (FTD-ID(RS)T-0259-81-Pt-1) 20 Aug. 1981 p 65-86 refs Transl. into ENGLISH from Recent Selected Papers of NW Polytech. Univ., pt. 1 (Xian Shaanxi), 1979

Avail: NTIS HC A17/MF A01

The method is comprised of three main parts: the mean S sub 2 streamsurface calculation, the approximate calculation of S sub 1 streamsurface of revolution, and defining the blade element on the conical surface and stacking the blade airfoil sections. The method is unusual in that the calculation stations for making the S sub 2 streamsurface computations are curves, and particularly in that the airfoil parameters of blade are calculated on a plane tangent to the approximate streamsurface of revolution. On this tangential plane, two dimensional flow is used as basic model to calculate the Mach wave system on the suction surface of cascade entrance region. T.M.

STRUCTURAL ANALYSIS OF FUSELAGES WITH CUTOUTS BY FINITE ELEMENT METHOD

G. Shoulian, Sun Can, Tang Xuunchun, and Ye Tiangi *In its* Recent Selected Papers of NW Polytech. Univ., pt. 1 (FTD-ID(RS)T-0259-81-Pt-1) 20 Aug. 1981 p 359-378 refs Transl. into ENGLISH from Recent Selected Papers of NW Polytech. Univ., pt. 1 (Xian Shaanxi), 1979

Avail: NTIS HC A17/MF A01

The rear part of a transport aircraft's fuselage was studied. It consists of two sections, the front section being a closed cylinder with a floor and the other section containing a large cutout. An idealized structure is considered to have 1950 degrees of freedom. In this analysis, three kinds of finite element were adopted: a flange element with various cross sections; a constant shear flow quadrilateral of arbitrary shape; and a beam element of various cross sections taking account of eccentricity of the nodes from the axes of moment and inertia. A factorization algorithm was adopted in the solution of the system of linear algebraic equations. T.M.

INITIAL EXPERIMENTAL RESEARCH INTO THE RESPONSE OF TURBOJET ENGINE COMPRESSORS TO DISTORTION OF INTAKE PRESSURE

Chen Fu-qun, Tang Di-yi, Hu Zi-long, Id Wen-lan, Yu Jin-di, Wu Xin-yuan, Zhao Jue-liang, Lin Qi-xun, Wang Zong-yuan, Liu Si-hong et al *In its* Recent Selected Papers of NW Polytech. Univ., pt. 2 (FTD-ID(RS)T-0260-81-Pt-2) 28 Aug. 1981 p 287-316 refs Transl. into ENGLISH from Recent Selected Papers of NW Polytech. Univ., pt. 2 (Xian Shaanxi), 1979

Avail: NTIS HC A18/MF A01

The influence which distorations in intake pressure have on the stability and characteristics of the compressors of turbojet engines was investigated. The test bed of a turbojet engines with a nine stage compressor was used as a test bed. The first stage of the compressor was transonic. It was concluded that the capabilities of compressors of this type of turbojet engine are not only determined by the capabilities or characteristics of the compressor but also by the structural arrangement and actual situation of the other components in system of the compressor. Other significant conclusions are reported. R.C.T.

A PRELIMINARY EXPERIMENTAL INVESTIGATION OF THE RESPONSE OF A TURBOJET ENGINE TO INLET PRESSURE DISTORTION
Chen Fu-qun, Tang Di-yi, Hu Zi-long, Id Wen-lan, Yu Jin-di, Wu Xin-yuan, Zhao Jue-liang, Lin Qi-xun, Wang Zong-yuan, and Liu Si-hong *In its* Recent Selected Papers of NW Polytech. Univ., pt. 2 (FTD-ID(RS)T-0260-81-Pt-2) 28 Aug. 1981 p 317-346 refs Transl. into ENGLISH from Recent Selected Papers of NW Polytech. Univ., pt. 2 (Xian Shaanxi), 1979

Avail: NTIS HC A18/MF A01

Preliminary experimental results about the effect of inlet pressure distortion on the characteristics and instability of the axial compressor of a turbojet engine are presented. The experiments were conducted on the test bed on a turbojet engine with a 9-stage compressor, whose first stage is transonic. The tests were run for each of the following cases: (1) at 99% design speed with 180 deg triple-deck 36 mesh screen in front of the engine inlet, i.e., 3x36 mesh; (2) at 90% design speed with 180 deg single-deck 36 mesh screen, i.e., 1x36 mesh; (3) at 90% design speed with clean inlet; and (4) at 87% design speed with a decrease of about 12% of the first stage turbine nozzle exit area. R.C.T.

N82-11008# Air Force Systems Command, Wright-Patterson AFB, Ohio. Foreign Technology Div.
AN EXPERIMENTAL INVESTIGATION OF THE ROTATING STALL, SURGE AND WAKE BEHIND THE ROTOR FOR A SINGLE STAGE AXIAL COMPRESSOR
Zhang Weide, Zheng Changsheng, Liu Zhiwei, and Liu Jiafeng *In its* Recent Selected Papers of NW Polytech. Univ., pt. 2 (FTD-ID(RS)T-0260-81-Pt-2) 28 Aug. 1981 p 347-370 refs Transl. into ENGLISH from Recent Selected Papers of NW Polytech. Univ., pt. 2 (Xian Shaanxi), 1979

Avail: NTIS HC A18/MF A01

Dynamic tests were conducted in order to investigate the rotating stall, surge, and wake behind the rotor of a single stage axial compressor. The relationship between the rotating stall and the total turbulence behind the rotor caused by the wake was also studied. It was found that the waveform of the wake behind the rotor shows marked changes when rotating stall approaches. The wake induced degree of total turbulence increases sharply, and therefore may be used as a way to predict rotating stall. The total process of rotating stall and surge as well as the differences between the two and their connection were also compared. R.C.T.

THE ARBITRARY QUASI-ORTHOGONAL SURFACE METHOD FOR COMPUTING THREE-DIMENSIONAL FLOW IN TURBINE MACHINERY. 2. CALCULATION OF THE THREE-DIMENSIONAL FLOW WITH THE S SUB 1-SURFACE TWISTED
Xin Xiao-Kang, Jiang Jin-Liang, and Zhu Shi-Can *In its* Acta Mech. Sinica (FTD-ID(RS)T-0704-81) 11 Sep. 1981 p 1-19 refs Transl. into ENGLISH from Acta Mech. Sinica (China), no. 1, 1979
Avail: NTIS HC A03/MF A01 CSCL 01/2

On the basis of the quasi-orthogonal surface method, a three-dimensional flow field solution of inviscous fluids in turbine machinery is obtained. This method, under the condition allowed by the storage of the computer, can calculate any shapes of S sub 1 and S sub 2 surfaces (including twisting S sub 1 surfaces) and obtain the shapes of space streamlines and the three-dimensional distribution of parameters such as velocity. The calculations for the two conditions of a centrifugal compressor with a small impeller (phi 110) indicate the relative value of the twist of the S sub 1 surface is about 3 to 10 percent. The S sub 1 surface shows a double twist like a twist drill from the inlet to the outlet. M.G.

THEORETICAL INVESTIGATIONS AND EXPERIMENTAL RESEARCHES FOR HIGHER SUBSONIC TWO-DIMENSIONAL COMPRESSOR CASCADE
Yan Ru-qun and Qian Zhao-yan *In its* J. of Eng. Thermophys. (Selected Articles) (FTD-ID(RS)T-0570-81) 16 Sep. 1981 p 1-34 refs Transl. into ENGLISH from Gongcheng Rewuli Xuebao (China), v. 2, no. 1, Feb. 1981 Presented at the 3rd Ann. All-China Thermophys. Eng. Technol. Conf., Gui Lin, China, Apr. 1980
Avail: NTIS HC A05/MF A01 CSCL 21/5

Compressible turbulence flow boundary layer theory and several characteristic boundary layer parameters (momentum thickness, form factors, energy factors and other combinational parameters) were combined with simplified gas flow speed distributions in the boundary layers in the wake behind the blade cascade and used to deduce, on the basis of the research foundation accumulated in the past about the theory of blade cascade losses, a simplified equation for the calculation of total two-dimensional blade cascade pressure losses for subsonic and transonic speeds. With this equation, it is possible to calculate the two-dimensional blade cascade pressure losses in designed operational configurations and off-designed operational configurations. A graphical method for determining the corrected gas compressibility effect in the blade cascade of compressors under operating conditions involving higher subsonic and transonic speeds is also introduced. (Selected Articles) (FTD-ID(RS)T-0570-81) 16 Sep. 1981 p 35-50 refs Transl. into ENGLISH from Gongcheng Rewuli Xuebao (China), v. 2, no. 1, Feb. 1981 Presented at the 3rd Ann. All-China Eng. Thermophys. and Technol. Conf., Gui Lin, China, Apr. 1980

Avail: NTIS HC A05/MF A01 CSCL 21/5

Changes in the gas flow velocity triangle behind the shock waves being considered were studied in an effort to analyze the effect which shock waves have on gas flow. A planar oblique relationship formula was used to deduce the corresponding values of changes in velocity moment, pressure losses, and total pressure ratios. This explains the important phenomenon involved when the supersonic intake cross section shock waves of transonic compressors cause addition pressurization of gas flow (supercharging). Aerodynamic and thermodynamic analyses and calculations were then carried out on the tip cross sections of the rotors. The characteristic curve calculations for the shock waves in front of the blade cascades and for the intake areas of these cascades are examined. Passageway shock waves are also calculated. Results are discussed. A.R.H.

WIND-TUNNEL RESULTS FOR A MODIFIED 17-PERCENT-THICK LOW-SPEED AIRFOIL SECTION

Robert J. McGhee and William D. Beasley Nov. 1981 87 p refs

(NASA-TP-1919; L-14666) Avail: NTIS HC A05/MF A01 CSCL 01A

Wind-tunnel tests were conducted in the Langley low-turbulence pressure tunnel to evaluate the effects on performance of modifying a 17-percent-thick low-speed airfoil. The airfoil contour was altered to reduce the pitching-moment coefficient by increasing the forward loading and to increase the climb lift-drag ratio by decreasing the aft upper surface pressure gradient. The tests were conducted over a Mach number range from 0.07 to 0.32, a chord Reynolds number range 1.0 x 10 to the 6th power to 12.0 x 10 to the 6th power, and an angle-of-attack range from about -10 deg to 20 deg. NEW ESTIMATION METHOD FOR FLUTTER OR DIVERGENCE BOUNDARY FROM RANDOM RESPONSES AT SUBCRITICAL SPEEDS

Yuji Matsuzaki and Yasukatsu Ando Apr. 1981 15 p refs

(NAL-TR-667T; ISSN-0389-4-10) Avail: NTIS HC A02/MF A01

A new technique for estimating the flutter or divergence boundary from responses due to turbulence at subcritical speeds is described. The boundary can be predicted without estimating or measuring the dampings and frequencies of the aeroelastic modes. The sampled time response is modeled by the mixed autoregressive moving average process. The orders and coefficients of both autogressive and moving average parts of the process are determined with the aid of Akaike's estimation procedure. The stability boundary is estimated by using Jury's stability determinants which are expressed in terms of the autogressive coefficients alone. The modal frequencies and dampings are also evaluated from the coefficients. The technique proposed has been applied with success to signals from a cantilever wing model tested in a low supersonic flow. Comparison between the actual and estimated flutter boundaries shows that an accurate estimation can be made from data obtained in a narrow range of the dynamic pressure which is sufficiently below the boundary. A STUDY ON NUMERICAL METHOD FOR EVALUATING SPANWISE INTEGRAL IN SUBSONIC LIFTING-SURFACE THEORY

Teruo Ichikawa Mar. 1981 22 p refs

(NAL-TR-661T; ISSN-3989-4010) Avail: NTIS HC A02/MF A01

Two disputable points are discussed. The first point is the coincidence of each collocation section with one of the spanwise integration points. The second point is the relatively small, but undesirable, sharp variation of the regularized influence functions near the collocation sections. Two proposals for coping with these difficulties are made. Their effects are examined by computing the downwash at the surface of a steady rectangular wing subjected to a simple wing loading. It is shown that method 1, which avoids the coincidence, makes it possible, with no losses in accuracy, to greatly reduce the computing time in cases of oscillating wings. Further, it is shown that remarkable improvement in convergence with respect to the number of spanwise integration points is obtained by method 2 which distributes the spanwise integration points densely only near the collocation sections. AIRCRAFT WING TRAILING-EDGE NOISE

Ronald L. Underwood and Thomas H. Hodgson 1981 145 p refs

(Grant NsG-1377)

(NASA-CR-164952) Avail: NTIS HC A07/MF A01 CSCL 01A

The mechanism and sound pressure level of the trailing-edge noise for two-dimensional turbulent boundary layer flow was examined. Experiment is compared with current theory. A NACA 0012 airfoil of 0.61 m chord and 0.46 m span was immersed in the laminar flow of a low turbulence open jet. A 2.54 cm width roughness strip was placed at 15 percent chord from the leading edge on both sides of the airfoil as a boundary layer trip so that two separate but statistically equivalent turbulent boundary layers were formed. Tests were performed with several trailing-edge geometries with the upstream velocity U sub infinity ranging from a value of 30.9 m/s up to 73.4 m/s. Properties of the boundary layer for the airfoil and pressure fluctuations in the vicinity of the trailing-edge were examined. A scattered pressure field due to the presence of the trailing-edge was observed and is suggested as a possible sound producing mechanism for the trailing-edge noise. T.M.

LOW SPEED TESTING OF THE INLETS DESIGNED FOR A TAMDEN-FAN V/STOL NACELLE

Robert C. Williams and Andres H. Ybarra (Vough Corp., Dallas) 1981 13 p refs Presented at the V/STOL Conf., Palo Alto, Calif., 7-9 Dec. 1981

(NASA-TM-82726; E-1031; AIAA-81-2627) Avail: NTIS HC A02/MF A01 CSCL 01A

An approximately 0.25 scale model of a tandem fan nacelle, designed for a subsonic V/STOL aircraft, was tested in a Lewis wind tunnel. Model variables included long and short aft inlet cowls and the addition of exterior strakes to the short inlet cowl. Inlet pressure recoveries and distortion were measured at pitch angles to 40 deg and at combinations of pitch and yaw to 30 deg. Airspeeds covered a range to 135 knots (69 m/sec). The short aft inlet with added strakes had the best aerodynamic performance and is considered suitable for the intended V/STOL application. T.M.

A SUMMARY OF V/STOL INLET ANALYSIS METHODS

Danny P. Hwang 1981 12 p refs Presented at the V/STOL Conf., Palo Alto, Calif., 7-9 Dec. 1981

(NASA-TM-82725; E-1027) Avail: NTIS HC A02/MF A01 CSCL 01A

Recent extensions and applications of the methods are emphasized. They include the specification of the Kutta condition for a slotted inlet, the calculation of suction and tangential blowing for boundary layer control, and the analysis of auxiliary inlet geometries at angles of attack. A comparison is made with experiment for the slotted inlet. An optimum diffuser velocity distribution was developed. T.M.

COMPUTATION OF HIGH REYNOLDS NUMBER INTERNAL/EXTERNAL FLOWS
Michael C. Cline and Richard G. Wilmoth 1981 12 p refs Presented at the 5th AIAA Computational Fluid Dyn. Conf., Palo Alto, Calif., 22-23 Jun. 1981
(Contract W-7405-eng-36)
(NASA-TM-84049; DE81-025343; LA-UR-81-1882; CONF-810664-2) Avail: NTIS HC A02/MF A01 CSCL 01A

A general, user oriented computer program, called VNAP2, was developed to calculate high Reynolds number, internal/external flows. The VNAP2 program solves the two dimensional, time dependent Navier-Stokes equations. The turbulence is modeled with either a mixing-length, a one transport equation, or a two transport equation model. Interior grid points are computed using the explicit MacCormack Scheme with special procedures to speed up the calculation in the fine grid. All boundary conditions are calculated using a reference plane characteristic scheme with the viscous terms treated as source terms. Several internal, external, and internal/external flow calculations are presented. DOE

THREAT ALERT AND COLLISION AVOIDANCE SYSTEM (TCAS) SYMPOSIUM
22 Jul. 1981 177 p refs Symp. held at Washington, D.C., 22 Jul. 1981
(AD-A104563; FAA-RD-81-76) Avail: NTIS HC A09/MF A01 CSCL 01/4

The Federal Aviation Administration held a symposium on Threat Alert and Collision Avoidance System (TCAS) in Washington, D.C., July 22, 1981, which was attended by representatives of 68 organizations and 21 airlines. This report contains the news release announcing the new approach to providing protection against mid-air collisions, 10 presentations and the transcript of the panel discussion. The TCAS will provide a range of capabilities and costs which will meet the requirements of all airspace users. The least complex part of the system is designed for private pilots and would cost about $2,500. The fully capable, or airline, version would cost between $45,000 and $50,000. This new concept represents a new capability which draws on all FAA has learned about collision avoidance in its past efforts, extends and simplifies FAA's efforts to date, provides new capabilities to all users, and is fully compatible with international standards and improvement activities on the Secondary Surveillance Radar (SSR). Optimal control algorithms for four-dimensional guidance of a transport aircraft were investigated for feasibility. Cost function constraints on the optimal reference path generator appeared impossible to achieve and the optimal guidance algorithms do not achieve significant performance improvement without excessive increases in sophistication and cost of the onboard avionics computer. A modularized existing Mission Management system allows a three-phase flight test plan to demonstrate the operational capability of the existing classical integrated flight trajectory control algorithms. PARAMETRIC STUDY OF MICROWAVE-POWERED HIGH-ALTITUDE AIRPLANE PLATFORMS DESIGNED FOR LINEAR FLIGHT
Charles E. K. Morris, Jr. Nov. 1981 74 p refs
(NASA-TP-1918; L-14606) Avail: NTIS HC A04/MF A01 CSCL 01C

The performance of a class of remotely piloted, microwave powered, high altitude airplane platforms is studied. The first part of each cycle of the flight profile consists of climb while the vehicle is tracked and powered by a microwave beam; this is followed by gliding flight back to a minimum altitude above a microwave station and initiation of another cycle. Parametric variations were used to define the effects of changes in the characteristics of the airplane aerodynamics, the energy transmission systems, the propulsion system, and winds. Results show that wind effects limit the reduction of wing loading and the increase of lift coefficient, two effective ways to obtain longer range and endurance for each flight cycle. Calculated climb performance showed strong sensitivity to some power and propulsion parameters. A simplified method of computing gliding endurance was developed. S.L.

ICING TUNNEL TESTS OF A COMPOSITE POROUS LEADING EDGE FOR USE WITH A LIQUID ANTI-ICE SYSTEM
David L. Kohlman Sep. 1981 21 p refs
(Grant NAG3-71)
(NASA-CR-164966; KU-FRL-464-3) Avail: NTIS HC A02/MF A01 CSCL 01C

The efficacy of liquid ice protection systems which distribute a glycol-water solution onto leading edge surfaces through a porous skin was demonstrated in tests conducted in the NASA Lewis icing research tunnel using a composite porous leading edge panels. The data obtained were compared with the performance of previously tested stainless steel leading edge with the same geometry. Results show: (1) anti-ice protection of a composite leading edge is possible for all the simulated conditions tested; (2) the glycol flow rates required to achieve anti-ice protection were generally much higher than those required for a stainless steel panel; (3) the low reservoir pressures of the glycol during test runs indicates that more uniform distribution of glycol, and therefore lower glycol flow rates, can probably be achieved by decreasing the porosity of the panel; and (4) significant weight savings can be achieved in fluid ice protection systems with composite porous leading edges. The resistance of composite panels to abrasion and erosion must yet be determined before they can be incorporated in production systems. A.R.H.

A COMPARISON OF THEORETICAL AND EXPERIMENTAL PRESSURE DISTRIBUTIONS FOR TWO ADVANCED FIGHTER WINGS
H. P. Haney (Vought Corp., Dallas) and R. M. Hicks Oct. 1981 87 p refs
(NASA-TM-81331; A-8741) Avail: NTIS HC A05/MF A01 CSCL 01C

A comparison was made between experimental pressure distributions measured during testing of the Vought A-7 fighter and the theoretical predictions of four transonic potential flow codes. Isolated wind and three wing-body codes were used for comparison. All comparisons are for transonic Mach numbers and include both attached and separate flows. In general, the wing-body codes gave better agreement with the experiment than did the isolated wing code but, because of the greater complexity of the geometry, were found to be considerably more expensive and less reliable. A NUMERICAL THREE-DIMENSIONAL TURBULENT SIMULATION OF A SUBSONIC VSTOL JET IN A CROSS-FLOW USING A FINITE ELEMENT ALGORITHM Final Report, Sep. 1979 - Sep. 1980
A. J. Baker, J. A. Orzechowski, and P. D. Manhardt Jun. 1981 72 p refs
(Contract N62269-79-C-0295)
(AD-A104514; NADC-79021-60) Avail: NTIS HC A04/MF A01 CSCL 01/3

The purpose of this study, the results of which are reported herein, was to formulate a mathematical model of the basic VSTOL jet, and to validate its appropriateness by performing a series of computational experiments on the discrete analog (numerical) approximation to the mathematical description. Since the VSTOL jet problem is essentially steady, turbulent and fully three-dimensional, the mathematical description must be quite comprehensive. The approach selected was to utilize a continuity-constrained, finite element algorithm for solution of the parabolized form of the time-averaged, three-dimensional Navier-Stokes equations (3DPNS). The essential ingredients of this algorithmic description are presented and discussed. A production finite element computer code (COMOC:3DPNS) was utilized to conduct the computational experiments, and the description of problem definition and data deck preparation is contained at the end of the report. The key results of the computational experiments are discussed, regarding the basic causal mechanisms of the VSTOL jet, as well as results for confirmation test cases documenting viability of the constructed computational model. OPERATIONAL ENVIRONMENT, METEOROLOGICAL CONDITIONS AND WEATHER FORECASTING
In its Rotorcraft Icing Aug. 1981 p 1-13 refs

Avail: NTIS HC A07/MF A01

Helicopter icing is a significant operational consideration for helicopters operating throughout Europe. Existing weather statistics demonstrate significant operational limitations during the winter months, and for as much as five percent of the time on a year-around basis. Unfortunately the existing meteorological data base is insufficient to describe the operating environment in which NATO rotorcraft must conduct flight. At present for design purposes, the United States Federal Air Regulation 25 Appendix C or the UK Icing Atmosphere are employed for determination of airworthiness release of helicopters. However, neither of these atmospheres adequately defines the operational environment. This condition is exacerbated by the fact that forecasting techniques are currently inadequate to allow unrestricted helicopter operations in icing conditions. Increased coordination among cloud physicists, forecasters, and helicopter icing specialists is needed - and ultimately a new icing atmosphere is required to better define the helicopter operational icing requirements. J.D.H.

TECHNOLOGY BASE FOR ICING INSTRUMENTATION AND MATHEMATICAL MODELLING
In its Rotorcraft Icing Aug. 1981 p 14-33 refs

Avail: NTIS HC A07/MF A01

The fundamental mechanisms of ice accretion and shedding from rotor airfoils are considered. It is felt that an opportunity exists to exploit a combination of two-dimensional model and three-dimensional model scale testing, measurement of ice release mechanisms, inclusion of heat transfer models, and consideration of icing simulation. These efforts should be aimed at development of analytical models verified by both laboratory and full-scale data which then can be used to better predict performance of rotors in icing conditions. Only with the above analytical basis can ice accretion and shedding characteristics become sufficiently predictable to permit the determination of what type of ice protection is necessary or, conversely, what degree of flight envelope release might be permitted with a given level of ice protection. Further improvement in research and development of operational icing sensors is recommended. J.D.H.

FACILITIES FOR DEVELOPMENT AND CLEARANCE
In its Rotorcraft Icing Aug. 1981 p 34-53

Avail: NTIS HC A07/MF A01

A catalog of all NATO icing test facilities was compiled. It is recommended that the Canadian National Research Council's small high speed icing tunnel is a one-of-a-kind facility that needs to be available to support analytical development recommended, and that the tunnel should be reactivated or replaced. A decision has been made to retain the Ottawa Spray Rig in operational status for the near future. Efforts underway at the NASA-Lewis Research Center regarding rehabilitation of the Icing Research Tunnel and considering a major new icing test facility are endorsed. The US Army Helicopter Icing Spray System Improvement Program is also supported by the Working Group and, as a recommendation for future discussion, the need for European airborne icing spray systems should be considered. A conclusion reached by the Working Group is that current full scale development and qualification facilities and procedures are extremely expensive and time consuming. J.D.H.

ICE PROTECTION SYSTEM TECHNOLOGY
In its Rotorcraft Icing Aug. 1981 p 54-99 refs

Avail: NTIS HC A07/MF A01

Deicing systems technology concepts are discussed. The conclusion is that electrothermal deicing systems are the only effective present system for broad application. However, it is noted that the cost of electrothermal deicing in terms of weight, power and expense is high, and provides an incentive for examination of alternatives. Therefore, additional work is clearly warranted on options such as ice phobics, fluid ice suppressant systems, pneumatic boots, vibratory surface systems, microwave and other hybrid systems concepts. It is recommended that the operational limitations of ice protected aircraft such as the Black Hawk and Puma, be explored with the ice protection systems deliberately turned off, so as to simulate an aircraft without (or with inoperative) ice protection. Only through such definition of the actual icing environment can a better estimation be made of the operational impact of icing conditions on helicopter flight operations. J.D.H.

The purpose of the Integrated Head-Up Display (I-HUD) program was to demonstrate the advantages associated with using a Liquid Crystal Matrix Display and Diffraction Optics combiner in the design and construction of a high brightness head-up display system. The program resulted in the design and fabrication of the I-HUD brassboard consisting of a pilot's display unit, built in a form factor similar to that of the production F16 HUD, and test support equipment. The following devices and modules were developed: A 350-by-350 pixel Liquid Crystal Matrix Display complete with custom LSI circuit drivers, a diffraction optics combiner, a diffraction optics diffusing screen, a specular mode projector, and custom lamp with a narrow band (green) spectral output. Although the completed I-HUD brassboard did not meet all of its design goals, it does demonstrate the feasibility of applying advanced technology to the designs of Head-Up Displays. The I-HUD program has succeeded in solving many of the fundamental design problems associated with this approach and stands as a milestone in the development of solid state display devices and the development of more highly reliable, cost effective Head-Up Displays. (AD-A104364; NADC-80254-60) Avail: NTIS HC A07/MF A01 CSCL 21/4

A fuel mass flowmeter was developed with the objective of accurately measuring the mass flow rate M-dot of various fuels and their mixtures, for flow rates from 91 to 11,364 kg/hr (200 to 25,000 lb/hr). The delivered system included: (1) an area averaging zigzag flow velocimeter cell, in which the fuel was interrogated in opposite directions by an alternating sequence of ultrasonic pulses, to determine the area averaged flow velocity, V-bar; (2) a densitometer based on the Clausius-Mosotti law, in which the fuel density rho is determined; and (3) electronics which computed rho and V-bar separately, and then generated a square wave output having a frequency proportional to the product of rho and V-bar, namely M-dot = rho(V-bar)A, where A = velocimeter cell cross sectional area. The transducers can operate beyond the temperature range -38 to +150 C, and the flow cell, with transducers, at pressures up to 1500 psig and in the 3-axis, 20 g, 5 to 2000 Hz vibration environment specified by MIL Std. 810-514.1, except for noise problems at a few discrete frequencies. The development of nonmission related status information is one area of rotary wing instrumentation which has not kept pace with the state of art. This includes raw data, discrete and summary status information related to the engine, transmission, rotor, fuel, hydraulic and electrical subsystems. The objective of this report is to define an efficient and cost effective data transmission method for an electronic master monitor and advisory display system (EMMADS). Several current standard and nonstandard data bus specifications which are applicable to the EMMADS system are introduced. Their tradeoff in terms of hardware, software and system considerations are compared. It should be noted that a typical standard bus specs addresses only the protocol and message formats, not the mechanization of the control algorithm. Hence there is a considerable variation in implementation and cost even for the same bus standard. The materials represent a snapshot of the current state of the art technology. The use of optical fiber instead of conventional electrical cable (such as coaxial) as the transmission medium is also investigated based on the current technical reports. The problems of electromagnetic interference (EMI), and rejection techniques are mentioned. GRA

NEW MOLDING METHOD OF THREE-DIMENSIONAL HOLLOW PHOTOELASTIC MODEL AND CENTRIFUGAL STRESS ANALYSIS OF AIR COOLED TURBINE BLADE MODEL
Toyoaki Yoshida, Katsutoshi Matsusue, Kitao Takahara, and Ryosaku Hashimoto May 1981 17 p refs In ENGLISH; JAPANESE Summary
(NAL-TR-427T; ISSN-0389-4010) Avail: NTIS HC A02/MF A01

A new molding method for a three dimensional hollow photoelastic model was invented and centrifugal stress analysis performed for air cooled turbine blade models to which the new method was applied. A distinctive feature of the molding method is the introduction of a copper coated wax core which forms a three dimensional hollow shape inside a model. The air cooled turbine photoelastic model with a coolant passage simulates the first stage rotor blade in the high temperature turbine full scale model HT-10H used at the NAL. The results of stress analysis cleared the critical regions and stress magnitude and thus they are of great aid to the successful development of a full scale turbine model. Author

LIGHTWEIGHT DIESEL ENGINE DESIGNS FOR COMMUTER TYPE AIRCRAFT
Alex P. Brouwers Jul. 1981 70 p refs
(Contract NAS3-22149)
(NASA-CR-165470; Rept-995) Avail: NTIS HC A04/MF A01 CSCL 21E

Conceptual designs and performance of advanced technology lightweight diesel engines, suitable for commuter type aircraft power plants are defined. Two engines are discussed, a 1491 kW (2000 SHP) eight-cylinder engine and a 895 kW (1200 SHP) six-cylinder engine. High performance and related advanced technologies are proposed such as insulated cylinders, very high injection pressures and high compressor and turbine efficiencies. The description of each engine includes concept drawings, a performance analysis, and weight data. Fuel flow data are given for full and partial power up to 7620m altitude. The performance data are also extrapolated over a power range from 671 kW(900 SHP) to 1864 kW (2500 SHP). The specific fuel consumption of the 1491 kW (2000 SHP) engine is 182 g/hWh (.299 lb/HPh) at cruise altitude, its weight 620 kg (1365 lb.) and specific weight .415 kg/kW (.683 lb/HP). The specific fuel consumption of the 895 kW (1200 SHP) engine is 187 g/hWh (.308 lb/HPh) at cruise altitude, its weight 465 kg (1025 lb.) and specific weight .520 kg/kW (.854 lb/HP). R.J.F.

SUBSONIC CASCADE WIND TUNNEL TESTS USING A COMPRESSOR CONFIGURATION OF DCA BLADES M.S. Thesis
Frank S. Cina Jun. 1981 210 p refs
(AD-A104597) Avail: NTIS HC A10/MF A01 CSCL 21/5

Tests are reported in which air incidence angle was varied to a cascade of 20 blades, 5 inches in chord with aspect ratio of 2.0 and solidity of 1.67. Preliminary blade element performance data were obtained using pneumatic probe surveys and surface pressures were also measured. Results of preparatory tests of a similar cascade of 15 C-series blades at a solidity of 1.28 are also included. Whereas the flow in the C-series blading cascade was always acceptable, the flow in the DCA blading cascade was not acceptable at negative incidence angles. A modification of the cascade inlet guide vanes is recommended which will guarantee periodic conditions and serve to generate more nearly uniform inlet flow at all test conditions. Author (GRA)

AN INFLUENCE COEFFICIENT METHOD FOR THE APPLICATION OF THE MODAL TECHNIQUE TO WING FLUTTER SUPPRESSION OF THE DAST ARW-1 WING Final Report
Samuel Pines Nov. 1981 49 p refs
(Contract NAS1-15593)
(NASA-CR-165772; AMA-81-25) Avail: NTIS HC A03/MF A01 CSCL 01C

The methods used to compute the mass, structural stiffness, and aerodynamic forces in the form of influence coefficient matrices as applied to a flutter analysis of the Drones for Aerodynamic and Structural Testing (DAST) Aeroelastic Research Wing. The DAST wing was chosen because wind tunnel flutter test data and zero speed vibration data of the modes and frequencies exist and are available for comparison. A derivation of the equations of motion that can be used to apply the modal method for flutter suppression is included. A comparison of the open loop flutter predictions with both wind tunnel data and other analytical methods is presented. S.L.

AEROACOUSTIC THEORY FOR NONCOMPACT WING-GUST INTERACTION
Rudolph Martinez and Sheila E. Widnall Oct. 1981 124 p refs
(Grant NsG-2142)
(FDRL-81-7) Avail: NTIS HC A06/MF A01 CSCL 01C

Three aeroacoustic models for noncompact wing-gust interaction were developed for subsonic flow. The first is that for a two dimensional (infinite span) wing passing through an oblique gust. The unsteady pressure field was obtained by the Wiener-Hopf technique; the airfoil loading and the associated acoustic field were calculated, respectively, by allowing the field point down on the airfoil surface, or by letting it go to infinity. The second model is a simple spanwise superposition of two dimensional solutions to account for three dimensional acoustic effects of wing rotation (for a helicopter blade, or some other rotating planform) and of finiteness of wing span. A three dimensional theory for a single gust was applied to calculate the acoustic signature in closed form due to blade vortex interaction in helicopters. The third model is that of a quarter infinite plate with side edge through a gust at high subsonic speed. An approximate solution for the three dimensional loading and the associated three dimensional acoustic field in closed form was obtained. The results reflected the acoustic effect of satisfying the correct loading condition at the side edge. R.J.F.

AIRCRAFT DIGITAL INPUT CONTROLLED HYDRAULIC ACTUATION AND CONTROL SYSTEM Final Report, Aug. 1977 - Dec. 1980
Eugene T. Raymond and Curtiss W. Robinson Mar. 1981 214 p refs
(Contract F33615-77-C-2034; AF Proj. 3145)
(AD-A104263; AFWAL-TR-81-2012) Avail: NTIS HC A10/MF A01 CSCL 09/2

The development of an incremental digitally-controlled electrohydraulic incremental digitally-controlled electrohydraulic actuation system (DEHA) is reported. An electronic digital controller and a prototype DEHA unit, with an electric-stepper-motor-driven rotary distributor valve, two hydraulic drive motors, and a torque-summing gearbox, were assembled. Significant reductions in the hydraulic power normally required with a conventional geared hydraulic motor system, and some degree of hydraulic power recovery were obtained. Author (GRA)

THEORY OF STOCHASTIC OPTIMAL CONTROL SOME BASIC NOTIONS
In AGARD Theory and Appl. of Optimal Control in Aerospace Systems Jul. 1981 19 p refs

Avail: NTIS HC A13/MF A01

The optimal control problem for stochastic systems is described in details. Several classes of policy are defined and compared. The corresponding solutions are deduced from Bellman's principle and discussed in connection with the concept of dual effect of the control. After the derivation of the optimal closed-loop solution for the linear quadratic Gaussian problem, several algorithms are proposed for the nonlinear problem and discussed in the perspective of their implementation in aerospace applications. T.M.

AN INTRODUCTION TO STOCHASIC OPTIMAL CONTROL THEORY
In AGARD Theory and Appl. of Optimal Control in Aerospace Systems Jul. 1981 33 p refs

Avail: NTIS HC A13/MF A01

The design of control logic that commands a dynamic system to a desired output or that augments the system's stability is facilitated if objectives are expressed in a quantitative criterion, because the optimization of this criterion establishes a feasible design point for control. If the information which the control logic must use is uncertain or if the dynamic system is forced by random disturbances, only the expected value can be optimized. The methodology for design is based upon stochastic optimal control theory. After introducing the dynamic models of interest, optimal control and estimation are presented separately. Limitations of this approach are addressed, and the unified design of linear stochastic optimal controllers for analog and digital implementations is described. The principal benefit of stochastic optimal control theory is that it provides an engineering framework within which practical control design can be accomplished for complex dynamic systems. T.M.

DESIGN CONSIDERATIONS FOR OPTIMAL FLIGHT CONTROL SYSTEMS
F. R. Gill *In* AGARD Theory and Appl. of Optimal Control in Aerospace Systems Jul. 1981 21 p refs

Avail: NTIS HC A13/MF A01

Following a review of the several interacting factors affecting the design of control laws for any kind of flight control system (FCS), the modelling problem is discussed, including accuracy requirements for computer models of the aircraft, FCS, external disturbances and sensor noise. The state-of-the-art in designing the control and scheduling laws is surveyed and the limits of conventional control techniques are exposed. To overcome these limits, the use of selected nonlinear control techniques is discussed, including the concept of redundant adaptation with safeguards. T.M.

PRACTICAL DESIGN AND REALIZATION OF A DIGITAL ADAPTIVE FLIGHT CONTROL SYSTEM
V. Krebs and U. Hartmann *In* AGARD Theory and Appl. of Optimal Control in Aerospace Systems Jul. 1981 22 p refs
Sponsored in part by the West German Ministry of Defense

Avail: NTIS HC A13/MF A01

A new approach for the design and the practical realization of a digital adaptive command and stability system is proposed. The control law for the longitudinal motion of the aircraft is obtained by state vector feedback using the MIL-F-8785 B handling qualities requirements. The design principle is based on decoupling of the angle of attack and pitch rate on the one hand and the pole allocation method for the eigenvalues of the control system on the other hand. Since the necessary gain factors contain unknown and variable aircraft parameters, an on-line fading-memory least squares algorithm for the estimation of these parameters is used. Only conventional aircraft sensors (rate gyros and accelerometers) and an airborne digital computer are necessary. Hybrid simulations of the complete system as well as flight test results demonstrate the efficiency of the concept. T.M.

CONTROL DESIGN OF FLEXIBLE SPACECRAFT
Robert E. Skelton *In* AGARD Theory and Appl. of Optimal Control in Aerospace Systems Jul. 1981 28 p refs

Avail: NTIS HC A13/MF A01

When compared to other large scale systems, flexible spacecraft have some peculiarities which can make control more difficult. Emphasis is placed upon the time domain and suboptimal linear quadratic guassian (LQG) methods, with special attention given to the effects of modeling errors. These effects are discussed in light of the model reduction problem, stability, and control design. Stability, controllability and observability computations are reduced to their simplest form possible to provide insight and to facilitate the location of sensors and actuators. The techniques of modal cost analysis are used to identify the critical parameters and the critical models of the structure. In the final stage of design, component cost analysis reveals which states of the optimal dynamical controller should be deleted to produce a reduced controller which is compatible with the on-line computer software limitations. T.M.

OPTIMUM CLIMB AND DESCENT TRAJECTORIES FOR AIRLINE MISSIONS
Heinz Erzberger *In* AGARD Theory and Appl. of Optimal Control in Aerospace Systems Jul. 1981 16 p refs

Avail: NTIS HC A13/MF A01 CSCL 01C

The characteristics of optimum fixed-range trajectories whose structure is constrained to climb, steady cruise, and descent segments are derived by application of optimal control theory. The performance function consists of the sum of fuel and time costs, referred to as direct operating cost (DOC). The state variable is range to go and the independent variable is energy. In this formulation a cruise segment always occurs at the optimum cruise energy for sufficiently large range. At short ranges (400 n. mi. and less), a cruise segment may also occur below the optimum cruise energy. The existence of such a cruise segment depends primarily on the fuel flow vs thrust characteristics and on thrust constraints. If thrust is a free control variable along with airspeed, it is shown that such cruise segments will not generally occur. If thrust is constrained to some maximum value in climb and to some minimum in descent, such cruise segments generally will occur. T.M.

APPLICATION OF NONLINEAR SYSTEMS INVERSES TO AUTOMATIC FLIGHT CONTROL DESIGN: SYSTEM CONCEPTS AND FLIGHT EVALUATIONS
George Meyer and Luigi Cicolani *In* AGARD Theory and Appl. of Optimal Control in Aerospace Systems Jul. 1981 29 p refs
Avail: NTIS HC A13/MF A01 CSCL 01C

A practical method for the design of automatic flight control systems for aircraft with complex characteristics and operational requirements, such as the powered lift STOL and V/STOL configurations, is presented. The method is effective for a large class of dynamic systems requiring multi-axis control which have highly coupled nonlinearities, redundant controls, and complex multidimensional operational envelopes. It exploits the concept of inverse dynamic systems, and an algorithm for the construction of inverse is given. A hierarchic structure for the total control logic with inverses is presented. The method is illustrated with an application to the Augmentor Wing Jet STOL Research Aircraft equipped with a digital flight control system. Results of flight evaluation of the control concept on this aircraft are presented. T.M.

MANAGEMENT OF REDUNDANCY IN FLIGHT CONTROL SYSTEMS USING OPTIMAL DECISION THEORY
In AGARD Theory and Appl. of Optimal Control in Aerospace

Systems Jul. 1981 12 p refs

Avail: NTIS HC A13/MF A01 CSCL 01C

The problem of using redundancy that exists between dissimilar systems in aircraft flight control is addressed. That is, using the redundancy that exists between a rate gyro and an accelerometer--devices that have dissimilar outputs which are related only through the dynamics of the aircraft motion. Management of this type of redundancy requires advanced logic so that the system can monitor failure status and can reconfigure itself in the event of one or more failures. An optimal decision theory was tutorially developed for the management of sensor redundancy and the theory is applied to two aircraft examples. The first example is the space shuttle and the second is a highly maneuvering high performance aircraft--the F8-C. The examples illustrate the redundancy management design process and the performance of the algorithms presented in failure detection and control law reconfiguration. T.M.

DEVELOPMENT OF MULTIVARIABLE CONTROLLERS FOR AIRCRAFT TURBINE ENGINES

Ronald L. DeHoff, Stephen M. Rock, and Muhammed M. Akhter *In* AGARD Theory and Appl. of Optimal Control in Aerospace Systems Jul. 1981 12 p refs

Avail: NTIS HC A13/MF A01

A model reference structure is discussed which is shown to be a flexible framework within which digital control programs of a wide variety of function and complexity can be formulated. The development of the plant reference model is discussed and trade-offs between accuracy and complexity presented. The techniques used to produce optimized, feed-forward state, control and output trajectories are presented. The well-known methods of regulator synthesis using quadratic performance functions are briefly reviewed and the results of several successful applications of this methodology are summarized. T.M.

ADAPTATION OF A TURBINE TEST FACILITY TO HIGH-TEMPERATURE RESEARCH

J. Francois, Y. LeBot, J. Michard, and P. Deguest Dec. 1980 30 p refs Transl. into ENGLISH from AGARD Conf. Proc. No. 229, Ankara, Sept.
(RAE-Lib-Trans-2064; BR78650) Copyright. Avail: Issuing Activity

A facility for research on a high temperature (1800 K) and high pressure (4.5 bar) turbine stage is described. The turbine operates in a realistic engine environment and is comprehensively instrumented to permit wide variation of mainstream and coolant flow parameters. The development of robust probes for the measurement of turbulence and temperature fluctuations and optical pyrometry techniques is described. Results of studies of nozzle guide vane heat transfer coefficients, metal temperatures and film cooling efficiency are presented together with rotor blade surface temperature distributions. The MINOS rig confirmed the validity of turbine design prediction methods by providing performance data to correlate theory, scale model testing and gas turbine engine testing. T.M.

EXPERIMENTAL STUDY OF FUEL HEATING AT LOW TEMPERATURES IN A WING TANK MODEL, VOLUME 1 Final Report

Francis J. Stockemer Aug. 1981 75 p refs
(Contract NAS3-21977)
(NASA-CR-165391; LR-29935-Vol-1) Avail: NTIS HC A04/MF A01 CSCL 21D

Scale model fuel heating systems for use with aviation hydrocarbon fuel at low temperatures were investigated. The effectiveness of the heating systems in providing flowability and pumpability at extreme low temperature when some freezing of the fuel would otherwise occur is evaluated. The test tank simulated a section of an outer wing tank, and was chilled on the upper and lower surfaces. Turbine engine lubricating oil was heated, and recirculating fuel transferred the heat. Fuels included: a commercial Jet A; an intermediate freeze point distillate; a higher freeze point distillate blended according to Experimental Referee Broadened Specification guidelines; and a higher freeze point paraffinic distillate used in a preceding investigation. Each fuel was chilled to selected temperature to evaluate unpumpable solid formation (holdup). Tests simulating extreme cold weather flight, without heating, provided baseline fuel holdup data. Heating and recirculating fuel increased bulk temperature significantly; it had a relativley small effect on temperature near the bottom of the tank. Methods which increased penetration of heated fuel into the lower boundary layer improved the capability for reducing holdup. S.L.

JET FUEL LOCKS TO SHALE OIL: THE 1980 TECHNOLOGY REVIEW

Herbert R. Lander May 1981 156 p refs Proceedings of Conf. held at Cincinnati, 19-20 Nov. 1980
(AF Proj. 2480)
(AD-A104414; AFWAL-TR-81-2063) Avail: NTIS HC A08/MF A01 CSCL 11/4

The progress of several Air Force shale oil related programs is reported. Three shale oil processing studies evaluating the yield, cost, and quality of JP-4 and JP-8 turbine fuel produced from whole crude shale oil are discussed. Details of a fourth program that produced 11,300 gallons of specification JP-4 from Geokinetics shale oil are reported. Some of this jet fuel was tested in Air Force Fuel Mainburner/Turbine Effects Programs and was shown to behave very similar to petroleum derived JP-4. An additional study concentrated on developing hydrotreating catalysts that would more efficiently convert shale oil into aviation turbine fuel. Author (GRA)

AN ASSESSMENT OF THE USE OF ANTIMISTING FUEL IN TURBOFAN ENGINES Final Report, Sep. 1979 - Nov. 1980

A. Fiorentino, R. DeSaro, and T. Franz Jun. 1981 53 p refs
(Contract NAS3-22045)
(NASA-CR-165258; AD-A104673; PWA-5697-29; FAA-CT-81-58) Avail: NTIS HC A04/MF A01 CSCL 21/4

An evaluation was made on the effects of using antimisting kerosene (AMK) on the performane of the components from the fuel system and the combustor of a current in-service JT8D aircraft engine. The objectives were to identify problems associated with using antimisting kerosene and to determine the extent of shearing or degradation required to allow the engine components to achieve satisfactory operation. The program consisted of a literature survey and a test program which evaluated the antimisting kerosene fuel in laboratory and bench component testing, and assessed the performance of the combustor in a high pressure facility and in an atitude relight/cold ignition facility. Performance of the fuel pump and control system was evaluated in an open loop simulation. Thus far, results of the program would not preclude the use of antimisting kerosene in a jet engine application. GRA

AN INVESTIGATION OF THE COMBUSTION PROCESS IN SOLID FUEL RAMJETS M.S. Thesis

William Vernon Goodwin Jun. 1981 58 p refs
(AD-A104603) Avail: NTIS HC A04/MF A01 CSCL 21/4

An experimental investigation was conducted into four areas of the solid fuel ramjet combustion process: (1) the effects of near-wall turbulent mixing and equivalance ratio on combustion efficiency, (2) the effects of bypass air on combustion efficiency, (3) the combustion process in a cylindrically perforated fuel grain with a twin side-dump/dome configuration, and (4) the comparison of experimental radial temperature profiles to computer generated radial profiles. Polymethylmethacrylate fuel grains were burned in a ramjet motor and a thrust stand. Combustion efficiencies were determined and compared for different configurations. It was found to be insensitive to variations in the mixture ratio and to near-wall mixing. Bypass air was found to adversely affect the combustion efficiency both in stable and unstable combustion environments. The twin side-dump/dome configuration was unable to sustain combustion for all conditions investigated. Theoretical radial temperature profiles were found to have larger near wall gradients than were measured experimentally. Author (GRA)

DESIGN OF AIRPORT PAVEMENTS FOR EXPANSIVE SOILS Final Report

R. Gordon McKeen Jan. 1981 198 p refs
(Contract F29601-76-C-0051)
(AD-A104660; NMERI-AP-37; FAA-RD-81-25) Avail: NTIS HC A09/MF A01 CSCL 08/13

Expansive soil subgrades exhibit volume changes with variation in moisture condition. These changes result in differential movement of airport pavements resting on these soils. Special design procedures must be used to account for the expansive soil activity during equilibration. In addition, special precautions are required to protect the subgrade from moisture variation with climate. Measurement of soil suction is a key step in quantifying moisture-induced soil behavior. Procedures are outlined for suction characterization of the soil and for estimating the in situ differential movement likely to occur under the pavement. Once the wavelength and amplitude characteristics of the differential movement are obtained, design calculations to select the thickness and materials for the pavement may proceed. GRA

AMPLIFIED CROSSFLOW DISTURBANCES IN THE LAMINAR BOUNDARY LAYER ON SWEPT WINGS WITH SUCTION

J. Ray Dagenhart Nov. 1981 90 p refs
(NASA-TP-1902; L-14423) Avail: NTIS HC A05/MF A01 CSCL 20D

Solution charts of the Orr-Sommerfeld equation for stationary crossflow disturbances are presented for 10 typical velocity profiles on a swept laminar flow control wing. The critical crossflow Reynolds number is shown to be a function of a boundary layer shape factor. Amplification rates for crosslow disturbaces are shown to be proportional to the maximum crossflow velocity. A computer stability program called MARIA, employing the amplification rate data for the 10 crossflow velocity profiles, is constructed. This code is shown to adequately approximate more involved computer stability codes using less than two percent as much computer time while retaining the essential physical disturbance growth model. INTEGRATED ANALYSIS OF ENGINE

Christos C. Chamis 1981 24 p refs Presented at the Ann. Meeting of the ASME, Washington, D.C., 16-21 Nov. 1981
(NASA-TM-82713; E-995) Avail: NTIS HC A02/MF A01 CSCL 20K

The need for light, durable, fuel efficient, cost effective aircraft requires the development of engine structures which are flexible, made from advaced materials (including composites), resist higher temperatures, maintain tighter clearances and have lower maintenance costs. The formal quantification of any or several of these requires integrated computer programs (multi-level and/or interdisciplinary analysis programs interconnected) for engine structural analysis/design. Several integrated analysis computer prorams are under development at Lewis Reseach Center. These programs include: (1) COBSTRAN-Composite Blade Structural Analysis, (2) CODSTRAN-Composite Durability Structural Analysis, (3) CISTRAN-Composite Impact Structural Analysis, (4) STAEBL-StruTailoring of Engine Blades, and (5) ESMOSS-Engine Structures Modeling Software System. Three other related programs, developed under Lewis sponsorship, are described. Author

STRUCTURAL ANALYSIS COMPUTER PROGRAMS FOR RIGID MULTICOMPONENT PAVEMENT STRUCTURES WITH DISCONTINUITIES, WESLIQID AND WESLAYER. REPORT 1: PROGRAM DEVELOPMENT AND NUMERICAL PRESENTATIONS Technical Report, 1 Oct. 1978 - 30 Sep. 1979

Yu T. Chou May 1981 150 p refs
(DA Proj. 4A7-62719-AT-40)
(AD-A104545; WES/TR/GL-81-8-1) Avail: NTIS HC A07/MF A01 CSCL 13/13

This study was conducted to develop finite element computer programs to calculate stresses and deflections in rigid pavements with cracks and joints subjected to loads and temperature warping, as well as in the supporting subgrade soil. The joints are connected by dowel bars or other load transfer devices. The slabs can have full or partial loss of subgrade support over designed regions of the slabs. Multiple-wheel loads can be handled and the number of wheels is not limited. Two programs were developed, one called WESLIQID and the other WESLAYER. The former is for pavements on liquid foundations and the latter is for linear layered elastic solids. Variable slab thicknesses and moduli of subgrade reaction are incorporated in the WESLIQID program, and any number of slabs arrayed in an arbitrary pattern can be handled. Because of larger computer storage requirement and computational complexity, the WESLAYER program is limited to two slabs. GRA

HELICOPTER ROTOR TRAILING EDGE NOISE Final Report

Robert H. Schlinker and Roy K. Amier Washington NASA Nov. 1981 150 p refs
(Contract NAS1-15730)
(NASA-CR-3470) Avail: NTIS HC A07/MF A01 CSCL 20A

A two dimensional section of a helicopter main rotor blade was tested in an acoustic wind tunnel at close to full-scale Reynolds numbers to obtain boundary layer data and acoustic data for use in developing an acoustic scaling law and testing a first principles trailing edge noise theory. Results were extended to the rotating frame coordinate system to develop a helicopter rotor trailing edge noise prediction. Comparisons of the calculated noise levels with helicopter flyover spectra demonstrate that trailing edge noise contributes significantly to the total helicopter noise spectrum at high frequencies. This noise mechanism is expected to control the minimum rotor noise. In the case of noise radiation from a local blade segment, the acoustic directivity pattern is predicted by the first principles trailing edge noise theory. Acoustic spectra are predicted by a scaling law which includes Mach number, boundary layer thickness and observer position. Spectrum shape and sound pressure level are also predicted by the first principles theory but the analysis does not predict the Strouhal value identifying the spectrum peak. A.R.H.

SEL AND EPNL NOISE DURATION COEFFICIENTS FOR THE 747 AND T-38 AIRCRAFT

William L. Willshire, Jr. Sep. 1981 12 p refs
(NASA-TM-83214) Avail: NTIS HC A02/MF A01 CSCL 20A

Duration coefficient were calculated for Boeing 747 and T-38 airplanes for sound exposure level (SEL) and effective perceived noise level (EPNL) scales. The measured SEL duration coefficients were 8.4 for the Boeing 747 and 5.5 for the T-38 result was in good agreement with a previous result for a similar F-5 airplane. In EPNL, the duration coefficients were 7.2 for the Boeing 747 and 5.7 for the T-38. The difference in the results between the two airplanes is believed to be due to their different engine noise source spectra. The difference in the Boeing 747 results in the two different metric was due to the different frequency weighting of A-weighted sound pressure level, used in SEL, and tone-corrected perceived noise level, used in EPNL, when applied to the 747 spectra. B.W.

ON THE KERNEL FUNCTION COLLOCATION METHOD IN STEADY SUBSONIC FLOW FOR WING WITH CONTROL SURFACES

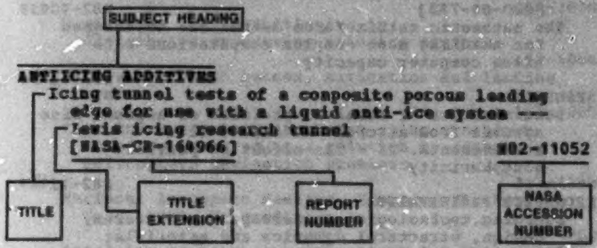
Chen Jing Song *In its* Acta Mech. Sinica (Selected Articles) (FTD-ID(RS)T-0705-81) 15 Sep. 1981 p 35-50 refs Transl. into ENGLISH from Acta Mech. Sinica (China), no. 2, 1979
Avail: NTIS HC A05/MF A01 CSCL 20/4

The forms of the lift distribution function for wings with control surfaces in steady subsonic flow are analyzed. Methods for treating kernel singularities of linear integral equations and singularities of the lift distribution function are discussed and the numerical solution to the integral equation is given. These methods may be used to calculate the lift distribution of the wing by itself or of the wing with partial or full control surfaces on both the leading and trailing edges. The numerical values agree well with experimental data and have the same accuracy as those given by other theories. As compared with the vortex lattice method, the computational storage requirement for this method is smaller and the computational time is less. The numerical computation may be carried out on smaller computers.

SUBJECT INDEX

AERONAUTICAL ENGINEERING/*A Continuing Bibliography (Suppl. 145)* FEBRUARY 1982

Typical Subject Index Listing



SUBJECT HEADING
ANTIICING ADDITIVES
Icing tunnel tests of a composite porous leading edge for use with a liquid anti-ice system --- Lewis icing research tunnel
[NASA-CR-164966] N82-11052
TITLE
TITLE EXTENSION
REPORT NUMBER
NASA ACCESSION NUMBER

The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, a title extension is added, separated from the title by hyphens. The NASA or AIAA accession number is included in each entry to assist the user in locating the abstract in the abstract section of this supplement. If applicable, a report number is also included as an aid in identifying the document.

A

A-7 AIRCRAFT
A comparison of theoretical and experimental pressure distributions for two advanced fighter wings
[NASA-TM-81351] N82-11054
System safety program plan --- electromagnetic pulse testing of the A-7E aircraft
[AD-A104557] N82-11354
A-300 AIRCRAFT
Active control elements on the transonic wing of the Airbus A-300 (ACTTA A). Airbus A-300 with reduced longitudinal stability (ACTTA-C) --- advanced control transonic transport aircraft (ACCTA); design considerations

Selected bibliography of NACA-NASA aircraft icing publications [NASA-TM-81651] N82-11053
System safety program plan --- electromagnetic pulse testing of the A-7E aircraft [AD-A104557] N82-11354
AIRCRAFT HYDRAULIC SYSTEMS
Fluid power technology for the '80s --- Book A82-10851
High-efficiency hydraulic power transfer units for multisystem aircraft A82-10853
'Quiet please' --- aircraft hydraulic systems noise reduction A82-10854
AIRCRAFT INSTRUMENTS
The evolution of airborne weather avoidance radar toward a calibrated remote rain gauge using REACT --- Rain Echo Attenuation Compensation Hardware A82-10225
Problems relating to the classical rate-gyro A82-10497
Optical sensors for displacement measurement A82-11407
Determination of vertical profiles of aerosol size spectra from aircraft radiative flux measurements. II - The effect of particle nonsphericity A82-12149
Commercial EMS considerations for small gas turbine engines --- automated engine monitoring systems A82-12449
Further application and development of an engine usage/life monitoring system for military services A82-12450
Hard limited approaches to correlation velocity sensing A82-12636
AIRCRAFT MAINTENANCE
Digital avionics: Promise and practice - An airlines experience in the field A82-11942
Mathematical model for the maintenance program of modern jet aircraft --- crack detection; inspection intervals [DFVLR-FB-81-14] N82-10002
AIRCRAFT MANEUVERS
Real-time, on-line digital simulation of optimum maneuvers of supersonic aircraft [AIAA 81-2178] A82-10127
Estimation of airplane stability and control derivatives from large amplitude longitudinal maneuvers [NASA-TM-83185] N82-10042
AIRCRAFT MODELS
Determination of airplane model structure from flight data by using modified stepwise regression [NASA-TP-1916] N82-10041
AIRCRAFT NOISE
'Quiet please' --- aircraft hydraulic systems noise reduction A82-10854
Model helicopter rotor impulsive noise A82-11300
Experimental modal analysis of the fuselage panels of an Aero Commander aircraft [NASA-CR-165750] N82-10028
Aeroacoustic theory for noncompact wing-gust interaction [FDRL-81-7] N82-11071
Effects of aircraft noise on the equilibrium of airport residents: Testing and utilization of a new methodology [NASA-TM-76628] N82-11636
Helicopter rotor trailing edge noise --- noise prediction [NASA-CR-3470] N82-11859
AIRCRAFT PARTS
Implementation of AVRADCOM MM&T --- for military aircraft parts production engineering A82-10545
Fatigue life of lugs under service loading - Test results and predictions A82-11605
AIRCRAFT PERFORMANCE
An airport wind shear detection and warning system using Doppler radar A82-10220
Design challenges of high performance aircraft POD EOCM cooling systems --- Electro-Optical/Countermeasure [ASME PAPER 81-ENAS-6] A82-10894
Ideal and simulated performance of an aircraft in the terrain following mission A82-11302
On the question of trailing airplane motion A82-11470
Fuel conservation - DC-9 series 20/30/40 A82-12563
Quiet short-haul research aircraft familiarization document, revision 1 [NASA-TM-81298] N82-10031
AIRCRAFT PILOTS
Relationships between naval aviation safety and pilot flight experience A82-11031
AIRCRAFT PRODUCTION
Automated Paint and Process Line /APPL/ --- for aircraft production [AIAA 81-2166] A82-10120

Development of aircraft production engineering discipline at IIT, Bombay
A82-11317

AIRCRAFT RELIABILITY
The certification of digital systems
A82-11940

AIRCRAFT SAFETY
FAA developing new collision avoidance, data acquisition and transmission systems
A82-10396
Test Pilots' Aviation Safety Workshop, U.S. Naval Postgraduate School, Monterey, CA, February 25-28, 1981, Proceedings
A82-10500
Electrical ground testing of aircraft antistatic protection
A82-10822

AIRCRAFT SPIN
Spin recovery training --- licensing requirement
[GPO-66-020] N82-10022

AIRCRAFT STABILITY
On computing Floquet transition matrices of rotorcraft
A82-11225
A note on fatal aircraft accidents involving metal fatigue
A82-11400
Numerical treatment of helicopter rotor stability problems
A82-12045
Estimation of airplane stability and control derivatives from large amplitude longitudinal maneuvers
[NASA-TM-83195] N82-10042

AIRCRAFT STRUCTURES
The application of improved aluminium alloys and steels in aircraft structures
A82-10305
Some possibilities for composite light aircraft construction
A82-10307
Sophisticated aircraft structure developments - Combat aeroplanes
A82-10309
Analytical determination of undercarriage retraction kinematics
A82-10364
The balloon and the airship technological heritage
[AIAA PAPER 81-1912] A82-10401
Design analysis of high temperature transparent windshields for high performance aircraft
[ASME PAPER 81-ENAS-5] A82-10893
Acoustic emission - An emerging technology for assessing fatigue damage in aircraft structure
A82-11149
Fatigue substantiation of non-linear structures
A82-11224
Dynamic response of aircraft structure to gun shock loads
A82-11314
Emerging technologies in aerospace structures, design, structural dynamics and materials; Proceedings of the Aerospace Conference, San Francisco, CA, August 13-15, 1980
A82-12026
Impact-initiated damage thresholds in composites
A82-12028
Response of nonlinear aircraft structural panels to high intensity noise
A82-12041
Quantification of the thermal environment for externally carried aircraft stores and ordnance
A82-12100
Fractographic determination of fatigue crack growth rates in aircraft components
A82-12697
Aircraft excrescence drag
[AGARD-AG-264] N82-10020
A method for determination of the aeroelastic behavior of aircraft with active control systems
[DFVLR-FB-81-05] N82-10047
Finite difference computation of the steady transonic potential flow around airplanes
N82-10981

AIRCRAFT SURVIVABILITY
Lightning effects on aircraft and composites. Literature study on lightning strikes and protection --- advanced composite materials
[FOA-C-20388-F9] N82-10024

AIRCRAFT WAKES
Strong matching method for computing transonic viscous flows including wakes and separations - Lifting airfoils
A82-10821

AIRFOIL PROFILES
The use of the Weber method for minicomputer-assisted numerical analysis of airfoils
A82-10362
Strong matching method for computing transonic viscous flows including wakes and separations - Lifting airfoils
A82-10821
Wind tunnel tests on airfoils in tandem cascade
A82-10987
Coupled fluid/structure response predictions for soft body impact of airfoil configurations --- ice and bird impact on aircraft engines
A82-12039
Wind-tunnel results for a modified 17-percent-thick low-speed airfoil section
[NASA-TP-1919] N82-11033
Aeroacoustic theory for noncompact wing-gust interaction
[FDRL-81-7] N82-11071

AIRFOILS
Icing tunnel test of a glycol-exuding porous leading edge ice protection system on a general aviation airfoil --- conducted in the Lewis Research Center icing research tunnel
[NASA-CR-165444] N82-10021
Second order approximation theory of an arbitrary aerofoil in compressible potential flow
N82-10982
Aerodynamic calculations and design of subcritical aerofoils
N82-10983
Matrix analysis of wings
N82-10998

AIRFRAME MATERIALS
Lightning effects on aircraft and composites. Literature study on lightning strikes and protection --- advanced composite materials
[FOA-C-20388-F9] N82-10024

AIRFRAMES
Development of aircraft production engineering discipline at IIT, Bombay
A82-11317
Design techniques for mutlivariable flight control systems
N82-11078

AIRLINE OPERATIONS
How large should a commuter transport be
[AIAA PAPER 81-1732] A82-10463
Optimum climb and descent trajectories for airline missions
N82-11082

AIRPORT TOWERS
FAA misses opportunities to discontinue or reduce operating hours of some airport traffic control towers
[PB81-224214] N82-11049

AIRPORTS
An airport wind shear detection and warning system using Doppler radar
A82-10220
Airport and Airway Improvement Act of 1981, part 1
[GPO-76-241-PT-1] N82-10062
Design of airport pavements for expansive soils
[AD-A104660] N82-11313
Effects of aircraft noise on the equilibrium of airport residents: Testing and utilization of a new methodology
[NASA-TM-76628] N82-11636

AIRSHIPS
Design aspects of non rigid airship envelopes
A82-10306
The balloon and the airship technological heritage
[AIAA PAPER 81-1912] A82-10401

AIRSPEED
Comparison of simulation and experimental data for a gliding parachute in dynamic flight
[AIAA PAPER 81-1924] A82-10409
Procedures and analysis techniques for determining static air minimum control speeds
A82-12564

ALUMINUM ALLOYS
The application of improved aluminium alloys and steels in aircraft structures
A82-10305
AMPLIFICATION
Characteristic and principal gains and phases and their use as multivariable control design tools --- generalizing Nyquist and root-locus diagram techniques
N82-10050
ANALYSIS (MATHEMATICS)
Multi-variable analysis and design techniques
[AGARD-LS-117] N82-10048
ANGLE OF ATTACK
Nonlinear prediction of subsonic aerodynamic loads on wings and bodies at high angles of attack
A82-11359
Estimation of airplane stability and control derivatives from large amplitude longitudinal maneuvers
[NASA-TM-83185] N82-10042
Aerodynamic calculations and design of subcritical aerofoils
N82-10983
ANTENNA DESIGN
Antenna theory and design --- Book
A82-12323
General aviation aircraft antennas for the global positioning system
[NASA-TM-83212] N82-11339
ANTENNA RADIATION PATTERNS
Antenna theory and design --- Book
A82-12323
ANTIICING ADDITIVES
Icing tunnel tests of a composite porous leading edge for use with a liquid anti-ice system --- Lewis icing research tunnel
[NASA-CR-164966] N82-11052
ANTIMISTING FUELS
An assessment of the use of antimisting fuel in turbofan engines
[NASA-CR-165258] N82-11230
ANTISHIP MISSILES
Air-film cooling returns to ramjets
[ASME PAPER 81-ENAS-8] A82-10896
APPROXIMATION
Multivariables design: The optimization of approximate inverses
N82-10057
Second order approximation theory of an arbitrary aerofoil in compressible potential flow
N82-10982
ARCHAEOLOGY
Radar mapping, archaeology, and ancient land use in the Maya lowlands
[NASA-CR-164931] N82-11514
ARCHITECTURE (COMPUTERS)
HiMAT onboard flight computer system architecture and qualification
[AIAA 81-2107] A82-10082
Airborne associative processor /ASPRO/ --- for early warning radar surveillance, command, and control applications
[AIAA 81-2145] A82-10104
AREA NAVIGATION
Use of Space Shuttle technology in conventional aircraft
[AIAA 81-2176] A82-10125
Discrete address beacon, navigation and landing system
A82-10650
ARMED FORCES (FOREIGN)
A proposed flight safety program for the Korean Air Force
[AD-A102373] N82-10023
ARROW WINGS
Effects of vortex flaps on the low-speed aerodynamic characteristics of an arrow wing
[NASA-TP-1914] N82-11013
ASTRIONICS
Memory requirements for future navigation systems
A82-12637
ATMOSPHERIC CIRCULATION
Multiple Doppler radar observations of PBL structure
A82-10292
ATMOSPHERIC ELECTRICITY
Electrical ground testing of aircraft antistatic protection
A82-10822
ATMOSPHERIC SCATTERING
Determination of vertical profiles of aerosol size spectra from aircraft radiative flux measurements. II - The effect of particle nonsphericity
A82-12149
ATMOSPHERIC SOUNDING
Limiting payload deceleration during ground impact
[AIAA PAPER 81-1918] A82-10404
ATMOSPHERIC TURBULENCE
Downbursts and microbursts - An aviation hazard --- downdrafts beneath thunderstorms
A82-10214
Detection and display of wind shear and turbulence
A82-10222
ATTITUDE CONTROL
Simulation study of a hybrid strapdown attitude and heading reference system
A82-12641
AUTOMATIC CONTROL
Problems relating to the classical rate-gyro
A82-10497
Application of nonlinear systems inverses to automatic flight control design: System concepts and flight evaluations
N82-11083
AUTOMATIC FLIGHT CONTROL
HiMAT onboard flight computer system architecture and qualification
[AIAA 81-2107] A82-10082
Controlling the software/hardware interface for the validation of avionics systems --- in flight control systems
[AIAA 81-2159] A82-10116
Ideal and simulated performance of an aircraft in the terrain following mission
A82-11302
The digital civil aircraft
A82-11938
AUTOMATIC LANDING CONTROL
Development and evaluation of automatic landing control laws for light wing loading STOL aircraft
[NASA-CR-166160] N82-10043
AUTOMATIC TEST EQUIPMENT
Air supply system bite for Boeing 767 airplane --- Built-In-Test-Equipment
[ASME PAPER 81-ENAS-7] A82-10895
Commercial EMS considerations for small gas turbine engines --- automated engine monitoring systems
A82-12449
AUTOMATION
Automated Paint and Process Line /APPL/ --- for aircraft production
[AIAA 81-2166] A82-10120
AUXILIARY POWER SOURCES
A new APU for medium place aircraft environmental control systems
[ASME PAPER 81-ENAS-1] A82-10889
AVIONICS
KC-135 Avionics Modernization Hot Bench
[AIAA 81-2105] A82-10081
Bridging the gap from aircraft to space computers
[AIAA 81-2142] A82-10101
Controlling the software/hardware interface for the validation of avionics systems --- in flight control systems
[AIAA 81-2159] A82-10116
Closed loop environmental control systems for fighter aircraft
[ASME PAPER 81-ENAS-2] A82-10890
Design challenges of high performance aircraft POD EOCM cooling systems --- Electro-Optical/Countermeasure
[ASME PAPER 81-ENAS-6] A82-10894
Sealed lead-acid batteries for aircraft applications
A82-11716
Applications of finite element method in aerospace power systems design
A82-11717
Advanced aircraft electric power system
A82-11718
Variable speed constant frequency /VSCF/ electrical system cuts cost of ownership
A82-11719
Digital avionics - Promise and practice; Proceedings of the Joint Symposium, London, England, March 20, 1980
A82-11934

The all digital military aircraft
A82-11937
The digital civil aircraft
A82-11938
Digital avionics systems - The RAF experience
A82-11941
Digital avionics: Promise and practice - An airlines experience in the field
A82-11942
Memory requirements for future navigation systems
A82-12637
The integrated inertial sensor assembly /IISA/ - A redundant strapdown system for advanced aircraft navigation and flight control functions
A82-12642
F-5G Tigershark
A82-12775
Electronic master monitor and advisory display system, data transmission study
[AD-A104243] N82-11064

AWACS AIRCRAFT
Airborne associative processor /ASPRO/ --- for early warning radar surveillance, command, and control applications
[AIAA 81-2145] A82-10104

AXIAL STRESS
Crack growth evaluation of a method to convert real-time loads history to a simplified engineering spectra --- for aircraft structural analysis
A82-12043

AXISYMMETRIC FLOW
On the prediction of swirling flowfields found in axisymmetric combustor geometries
A82-12120

B

BALLISTICS
Aeroballistic characteristics of sonobuoy parachute decelerators limited to a length of three feet
[AIAA PAPER 81-1950] A82-10425

BALLOON FLIGHT
A new thermal and trajectory model for high altitude balloons
[AIAA PAPER 81-1926] A82-10411

BALLOON-BORNE INSTRUMENTS
Limiting payload deceleration during ground impact
[AIAA PAPER 81-1918] A82-10404

BALLOONS
The balloon and the airship technological heritage
[AIAA PAPER 81-1912] A82-10401

BEAMS (SUPPORTS)
Matrix analysis of wings
N82-10998

BELLOWS
Low maintenance hydraulic accumulator
[AD-A103947] N82-10034

BENDING FATIGUE
Matrix analysis of wings
N82-10998

BIBLIOGRAPHIES
Selected bibliography of NACA-NASA aircraft icing publications
[NASA-TM-81651] N82-11053

BIT SYNCHRONIZATION
Synchronous fault-tolerant flight control systems
[AIAA 81-2109] A82-10083

BLADE SLAP NOISE
Model helicopter rotor impulsive noise
A82-11300

BODY-WING AND TAIL CONFIGURATIONS
Experimental study of empennage snap-through vibrations
A82-11471

BODY-WING CONFIGURATIONS
Acta mechanica sinica
[AD-A105184] N82-11014
The principles and methods for shaping the wing root regions of a wing-body combination at transonic and lower supersonic speeds
N82-11016

BOEING 747 AIRCRAFT
SEL and EPNL noise duration coefficients for the 747 and T-38 aircraft
[NASA-TM-83214] N82-11860

BOEING 767 AIRCRAFT
Air supply system bite for Boeing 767 airplane --- Built-In-Test-Equipment
[ASME PAPER 81-ENAS-7] A82-10895

BOUNDARY LAYER CONTROL
Developments in boundary layer Thrust Vector Control
A82-10855
New estimation method for flutter or divergence boundary from random responses at subcritical speeds
[NAL-TR-667T] N82-11034
Amplified crossflow disturbances in the laminar boundary layer on swept wings with suction
[NASA-TP-1902] N82-11391

BOUNDARY LAYER FLOW
Multiple-scale turbulence modeling of free turbulent flows
[ASME PAPER 81-FE-20] A82-10934

BOUNDARY LAYER SEPARATION
A summary of V/STOL inlet analysis methods
[NASA-TM-82725] N82-11043

BOUNDARY LAYERS
Aircraft excrescence drag
[AGARD-AG-264] N82-10020
Aircraft wing trailing-edge noise
[NASA-CR-164952] N82-11039

BRAKES (FOR ARRESTING MOTION)
Aeroballistic characteristics of sonobuoy parachute decelerators limited to a length of three feet
[AIAA PAPER 81-1950] A82-10425

C

C-135 AIRCRAFT
KC-135 Avionics Modernization Hot Bench
[AIAA 81-2105] A82-10081

CALIBRATING
In-situ calibration of flight heat transfer instrumentation
[ASME PAPER 81-ENAS-13] A82-10901

CANOPIES
Aerodynamics and performance of cruciform parachute canopies
[AIAA PAPER 81-1919] A82-10405
Experimental determination of parachute apparent mass and its significance in predicting dynamic stability
[AIAA PAPER 81-1920] A82-10406
Theoretical analysis of parachute inflation including fluid kinetics
[AIAA PAPER 81-1925] A82-10410
The net-skirt to a parachute canopy as a device to prevent inversion
[AIAA PAPER 81-1927] A82-10412
Stress measurements in a ribbon parachute canopy during inflation and at steady state
[AIAA PAPER 81-1944] A82-10420
Stress measurements in bias constructed parachute canopies during inflation and at steady-state
[AIAA PAPER 81-1945] A82-10421

CAPACITORS
High voltage surge and partial discharge test to evaluate aerospace equipment parts
A82-11740

CARBON FIBER REINFORCED PLASTICS
Sophisticated aircraft structure developments - Combat aeroplanes
A82-10309
On the use of carbon composites in slat and stabilizer construction
A82-11468
A CFRP taileron for the Tornado: Construction and production --- horizontal stabilizer
[MBB-FE-212/KFK/PUB/2] N82-10035

CARGO AIRCRAFT
ACMA - Fact or fantasy --- Advanced Civilian/Military Aircraft
A82-12048

CASCADE FLOW
Wind tunnel tests on airfoils in tandem cascade
A82-10987
End losses in turbine cascades with porous cooling
A82-11434
Theoretical investigations and experimental researches for higher subsonic two-dimensional compressor cascade
N82-11024

Subsonic cascade wind tunnel tests using a compressor configuration of DCA blades
[AD-A104597] N82-11069

CEILINGS (ARCHITECTURE)
Evaluation of the acoustic measurement capability of the NASA Langley V/STOL wind tunnel open test section with acoustically absorbent ceiling and floor treatments
[NASA-CR-165796] N82-10059

CENTRAL AMERICA
Radar mapping, archaeology, and ancient land use in the Maya lowlands
[NASA-CR-164931] N82-11514

CERAMICS
Development of low modulus material for use in ceramic gas path seal applications
[NASA-CR-165469] N82-10039

CERTIFICATION
The certification of digital systems
A82-11940

CHANNEL NOISE
Tangential sensitivity of EW receivers
A82-11020

CIRCULATION CONTROL ROTORS
An investigation of a stoppable helicopter rotor with circulation control --- ames 40 by 80 foot wind tunnel
[NASA-TM-81218] N82-10030

CIVIL AVIATION
The digital civil aircraft
A82-11938

Digital avionics: Promise and practice - An airlines experience in the field
A82-11942

CLEAR AIR TURBULENCE
Instrumented aircraft verification of clear-air radar detection of low-level wind shear
A82-10221

COAL LIQUEFACTION
Jet fuel from carbon
A82-12021

COAL UTILIZATION
Jet fuel from carbon
A82-12021

COLLISION AVOIDANCE
FAA developing new collision avoidance, data acquisition and transmission systems
A82-10396

Threat Alert and Collision Avoidance System (TCAS) Symposium
[AD-A104563] N82-11047

COMBUSTION CHAMBERS
One reason for the onset of high-frequency self-excited oscillations --- in combustion chambers of aircraft engines
A82-11448

The CIVIC - A concept in vortex induced combustion. II
[ASME PAPER 81-GT-12] A82-11997

Application of numerical modeling to gas turbine combustor development problems
A82-12118

On the prediction of swirling flowfields found in axisymmetric combustor geometries
A82-12120

Validation studies of turbulence and combustion models for aircraft gas turbine combustors
A82-12267

COMBUSTION PHYSICS
An investigation of the combustion process in solid fuel ramjets
[AD-A104603] N82-11232

COMBUSTION STABILITY
One reason for the onset of high-frequency self-excited oscillations --- in combustion chambers of aircraft engines
A82-11448

COMMAND AND CONTROL
Interoperability testing of decentralized command, control, communications and intelligence /C3I/ systems
[AIAA 81-2205] A82-10143

COMMERCIAL AIRCRAFT
ACMA - Fact or fantasy --- Advanced Civilian/Military Aircraft
A82-12048

Lightweight diesel engine designs for commuter type aircraft
[NASA-CR-165470] N82-11068

COMMUNICATION NETWORKS
Interoperability testing of decentralized command, control, communications and intelligence /C3I/ systems
[AIAA 81-2205] A82-10143

A solution to the static geometry problem for JTIDS relative navigation
A82-12634

Omega station 10.2 kHz signal selection made easy
A82-12638

COMPONENT RELIABILITY
Extending the limits of reliability theory --- Book
A82-12318

COMPOSITE MATERIALS
Some possibilities for composite light aircraft construction
A82-10307

Light aircraft structural design in non-metallics - Use of composite honeycomb for light aircraft
A82-10308

Emerging technologies in aerospace structures, design, structural dynamics and materials; Proceedings of the Aerospace Conference, San Francisco, CA, August 13-15, 1980
A82-12026

Impact-initiated damage thresholds in composites
A82-12028

Lightning effects on aircraft and composites. Literature study on lightning strikes and protection --- advanced composite materials
[FOA-C-20388-P9] N82-10024

COMPOSITE STRUCTURES
Composite main rotor tubular braided
A82-10547

Development of the Triflex rotor head
A82-11222

Icing tunnel tests of a composite porous leading edge for use with a liquid anti-ice system --- Lewis icing research tunnel
[NASA-CR-164956] N82-11052

COMPRESSIBILITY EFFECTS
Theoretical investigations and experimental researches for higher subsonic two-dimensional compressor cascade
N82-11024

COMPRESSIVE STRENGTH
Seven years experience with Kevlar-49 in the Lockheed L-1011 Tristar
A82-12647

COMPRESSOR BLADES
An aerodynamic design method for transonic axial flow compressor stage
N82-10984

Subsonic cascade wind tunnel tests using a compressor configuration of DCA blades
[AD-A104597] N82-11069

COMPUTATIONAL FLUID DYNAMICS
The use of the Weber method for minicomputer-assisted numerical analysis of airfoils
A82-10362

Theoretical analysis of parachute inflation including fluid kinetics
[AIAA PAPER 81-1925] A82-10410

Strong matching method for computing transonic viscous flows including wakes and separations - Lifting airfoils
A82-10821

Multiple-scale turbulence modeling of free turbulent flows
[ASME PAPER 81-FE-20] A82-10934

Control laws for adaptive wind tunnels
A82-10985

Calculation of aerodynamic characteristics of jet flapped airplane
A82-11459

Validation studies of turbulence and combustion models for aircraft gas turbine combustors
A82-12267

Acta mechanica sinica
[AD-A105184] N82-11014

The arbitrary quasi-orthogonal surface method for computing three-dimensional flow in turbine machinery. 2. Calculation of the three-dimensional flow with the S sub 1-surface twisted
N82-11015

Computation of high Reynolds number
internal/external flows
[NASA-TM-84049] N82-11046

COMPUTER DESIGN
Bridging the gap from aircraft to space computers
[AIAA 81-2142] A82-10101
Airborne associative processor /ASPRO/ --- for
early warning radar surveillance, command, and
control applications
[AIAA 81-2145] A82-10104

COMPUTER GRAPHICS
Integration of computer graphics design with
analytical models --- for aircraft design
[AIAA 81-2134] A82-10096
Improving the MLS through enhanced cockpit displays
A82-10649
Solution to the hidden-line problem
A82-12803

COMPUTER PROGRAMS
The Space Shuttle vehicle checkout involving
flight avionics software
[AIAA 81-2141] A82-10100
Controlling the software/hardware interface for
the validation of avionics systems --- in flight
control systems
[AIAA 81-2159] A82-10116
The certification of digital systems
A82-11940
Digital avionics systems - The RAF experience
A82-11941
Flight test results of the model simulation
controller for the HFB 320 for in-flight
simulation of the A310 airbus
[ESA-TT-660] N82-10107
Computation of high Reynolds number
internal/external flows
[NASA-TM-84049] N82-11046
Integrated analysis of engine
[NASA-TM-82713] N82-11491
Structural analysis computer programs for rigid
multicomponent pavement structures with
discontinuities, WESLIQID and WESLAYER. Report
1: Program development and numerical presentations
[AD-A104545] N82-11498

COMPUTER STORAGE DEVICES
Memory requirements for future navigation systems
A82-12637

COMPUTER SYSTEMS DESIGN
KC-135 Avionics Modernization Hot Bench
[AIAA 81-2105] A82-10081
Synchronous fault-tolerant flight control systems
[AIAA 81-2109] A82-10083
Navigation task partitioning in
distributed-processing avionics systems
A82-10646

COMPUTER SYSTEMS SIMULATION
Performance analysis of enroute air traffic
control computers in the National Airspace System
[AIAA 81-2203] A82-10140

COMPUTERIZED DESIGN
Integration of computer graphics design with
analytical models --- for aircraft design
[AIAA 81-2134] A82-10096
Solution to the hidden-line problem
A82-12803
Multi-variable analysis and design techniques
[AGARD-LS-117] N82-10048
Characteristic and principal gains and phases and
their use as multivariable control design tools
--- generalizing Nyquist and root-locus diagram
techniques
N82-10050
LQG multivariable design tools
N82-10054
The automatic matrix force method and techniques
for handling more complex computations with
given computer capacity
N82-10994

COMPUTERIZED SIMULATION
A new thermal and trajectory model for high
altitude balloons
[AIAA PAPER 81-1926] A82-10411
Ideal and simulated performance of an aircraft in
the terrain following mission
A82-11302
Application of numerical modeling to gas turbine
combustor development problems
A82-12118

CONCRETE STRUCTURES
Structural analysis computer programs for rigid
multicomponent pavement structures with
discontinuities, WESLIQID and WESLAYER. Report
1: Program development and numerical presentations
[AD-A104545] N82-11498

CONFERENCES
Test Pilots' Aviation Safety Workshop, U.S. Naval
Postgraduate School, Monterey, CA, February
25-28, 1981, Proceedings
A82-10500
Digital avionics - Promise and practice;
Proceedings of the Joint Symposium, London,
England, March 20, 1980
A82-11934
Emerging technologies in aerospace structures,
design, structural dynamics and materials;
Proceedings of the Aerospace Conference, San
Francisco, CA, August 13-15, 1980
A82-12026
Powder metallurgy superalloys - Aerospace
materials for the 1980's; Proceedings of the
Conference, Zurich, Switzerland, November 18-20,
1980. Volume 1
A82-12495
National Aerospace Meeting, Trevose, PA, April
8-10, 1981, Proceedings
A82-12626
Kevlar composites; Proceedings of the Symposium,
El Segundo, CA, December 2, 1980
A82-12646
The Shock and Vibration Digest, volume 13, no. 9
[AD-A105062] N82-10421

CONGRESSIONAL REPORTS
Spin recovery training --- licensing requirement
[GPO-66-020] N82-10022
Airport and Airway Improvement Act of 1981, part 1
[GPO-76-241-PT-1] N82-10062

CONSTRUCTION
Development and construction of pilot ejector
seats in Germany from 1938-1945
[DFVLR-FB-81-04] N82-10026
A CFRP taileron for the Tornado: Construction and
production --- horizontal stabilizer
[MBB-FE-212/KFK/PUB/2] N82-10035

CONTROL BOARDS
Electronic master monitor and advisory display
system, human engineering summary report
[AD-A104244] N82-11065

CONTROL EQUIPMENT
Considerations and applications for the use of
fluidics in aerospace controls
A82-12087
Management of redundancy in flight control systems
using optimal decision theory
N82-11084

CONTROL STABILITY
Characteristic and principal gains and phases and
their use as multivariable control design tools
--- generalizing Nyquist and root-locus diagram
techniques
N82-10050
Design of high integrity multivariable control
systems
N82-10055

CONTROL SURFACES
On the kernel function collocation method in
steady subsonic flow for wing with control
surfaces
N82-12023

CONTROL THEORY
Design considerations for the direct digital
control of dry-tuned gyroscope
A82-11933
Control of electromechanical actuator elements for
flight vehicles --- Russian book
A82-12170
Theory and applications of optimal control in
aerospace systems
[AGARD-AG-251] N82-11073
An introduction to stochasic optimal control theory
N82-11076

CONTROLLABILITY
Theoretical investigation of the influence of
spoiler dynamics on the handling qualities of an
aircraft with direct lift control
[ESA-TT-681] N82-10036

CONTROLLERS
Multi-variable analysis and design techniques
[AGARD-LS-117] N82-10048
The need for multivariable design and analysis techniques
N82-10049
Feedback and minimax sensitivity
N82-10058
Development of multivariable controllers for aircraft turbine engines
N82-11087

COOLING
End losses in turbine cascades with porous cooling
A82-11434

COOLING SYSTEMS
Design challenges of high performance aircraft POD EOCM cooling systems --- Electro-Optical/Countermeasure
[ASME PAPER 81-ENAS-6] A82-10894

CORES
New molding method of three-dimensional hollow photoelastic model and centrifugal stress analysis of air cooled turbine blade model
[NAL-TR-427T] N82-11067

CORRELATION
Hard limited approaches to correlation velocity sensing
A82-12636

CORROSION PREVENTION
A protective additive for jet fuels
A82-12022

COST REDUCTION
Variable speed constant frequency /VSCF/ electrical system cuts cost of ownership
A82-11719
ACMA - Fact or fantasy --- Advanced Civilian/Military Aircraft
A82-12048
Cost reduction in air transportation --- energy conservation
[SNIAS-811-150-101] N82-10025
FAA misses opportunities to discontinue or reduce operating hours of some airport traffic control towers
[PB81-224214] N82-11049

COWLINGS
Low speed testing of the inlets designed for a tandem-fan V/STOL nacelle --- conducted in the Lewis 10 by 10 foot wind tunnel
[NASA-TM-82728] N82-11042

CRACK PROPAGATION
Acoustic emission - An emerging technology for assessing fatigue damage in aircraft structure
A82-11149
Crack growth evaluation of a method to convert real-time loads history to a simplified engineering spectra --- for aircraft structural analysis
A82-12043
Fractographic determination of fatigue crack growth rates in aircraft components
A82-12697

CRITICAL FLOW
Aerodynamic calculations and design of subcritical aerofoils
N82-10983

CRITICAL LOADING
Impact-initiated damage thresholds in composites
A82-12028

CROSS FLOW
A numerical three-dimensional turbulent simulation of a subsonic VSTOL jet in a cross-flow using a finite element algorithm
[AD-A104514] N82-11055
Amplified crossflow disturbances in the laminar boundary layer on swept wings with suction
[NASA-TP-1902] N82-11391

CRYOGENIC WIND TUNNELS
Design predictions for noise control in the cryogenic National Transonic Facility
A82-12025

CYCLIC LOADS
Fatigue substantiation of non-linear structures
A82-11224

D

DAMAGE ASSESSMENT
Acoustic emission - An emerging technology for assessing fatigue damage in aircraft structure
A82-11149

DAMPING
New estimation method for flutter or divergence boundary from random responses at subcritical speeds
[NAL-TR-667T] N82-11034

DATA ACQUISITION
A microprocessor-based data acquisition system for stall/spin research
[AIAA 81-2177] A82-10126
FAA developing new collision avoidance, data acquisition and transmission systems
A82-10396

DATA TRANSMISSION
FAA developing new collision avoidance, data acquisition and transmission systems
A82-10396
Electronic master monitor and advisory display system, data transmission study
[AD-A104243] N82-11064

DC 9 AIRCRAFT
Fuel conservation - DC-9 series 20/30/40
A82-12563

DECELERATION
Limiting payload deceleration during ground impact
[AIAA PAPER 81-1918] A82-10404

DECISION MAKING
Management of redundancy in flight control systems using optimal decision theory
N82-11084

DEICERS
Rotorcraft icing: Status and prospects
[AGARD-AR-166] N82-11056
Ice protection system technology
N82-11060

DEICING
Icing tunnel test of a glycol-exuding porous leading edge ice protection system on a general aviation airfoil --- conducted in the Lewis Research Center icing research tunnel
[NASA-CR-165444] N82-10021

DELTA WINGS
Formation of triangular-element stiffness matrix using sliding interpolation
A82-11464
Increasing the lift:drag ratio of a flat delta wing
A82-11899

DESIGN ANALYSIS
Development of new lifting parachute designs with increased trim angle
[AIAA PAPER 81-1921] A82-10407
Optimization of the principal design parameters of a passenger aircraft
A82-10816
Design analysis of high temperature transparent windshields for high performance aircraft
[ASME PAPER 81-ENAS-5] A82-10893
Parachute technology under pressure
A82-12804

DIESEL ENGINES
Lightweight diesel engine designs for commuter type aircraft
[NASA-CR-165470] N82-11068

DIFFUSION ELECTRODES
Unsolved problems of nickel cadmium batteries
A82-11725

DIGITAL COMPUTERS
Aircraft digital input controlled hydraulic actuation and control system
[AD-A104263] N82-11072

DIGITAL RADAR SYSTEMS
The evolution of airborne weather avoidance radar toward a calibrated remote rain gauge using REACT --- Rain Echo Attenuation Compensation Hardware
A82-10225

DIGITAL SIMULATION
Real-time, on-line digital simulation of optimum maneuvers of supersonic aircraft
[AIAA 81-2178] A82-10127

DIGITAL SYSTEMS
- Digital avionics - Promise and practice; Proceedings of the Joint Symposium, London, England, March 20, 1980 A82-11934
- The all digital military aircraft A82-11937
- The digital civil aircraft A82-11938
- The certification of digital systems A82-11940
- Digital avionics systems - The RAF experience A82-11941
- Digital avionics: Promise and practice - An airlines experience in the field A82-11942
- Practical design and realization of a digital adaptive flight control system N82-11079
- Control law design for transport aircraft flight tasks N82-11080
- Application of nonlinear systems inverses to automatic flight control design: System concepts and flight evaluations N82-11083

DIGITAL TECHNIQUES
- Use of Space Shuttle technology in conventional aircraft [AIAA 81-2176] A82-10125
- Air supply system bite for Boeing 767 airplane --- Built-In-Test-Equipment [ASME PAPER 81-ENAS-7] A82-10895
- Design considerations for the direct digital control of dry-tuned gyroscope A82-11933

DIRECT LIFT CONTROLS
- Theoretical investigation of the influence of spoiler dynamics on the handling qualities of an aircraft with direct lift control [ESA-TT-681] N82-10036
- Development and evaluation of automatic landing control laws for light wing loading STOL aircraft [NASA-CR-166160] N82-10043

DISCRETE ADDRESS BEACON SYSTEM
- Discrete address beacon, navigation and landing system A82-10650

DISPERSIONS
- The dispersion of drop sizes in gas turbine fuel nozzle sprays A82-12107

DISPLACEMENT MEASUREMENT
- Optical sensors for displacement measurement A82-11407

DISPLAY DEVICES
- Improving the MLS through enhanced cockpit displays A82-10649
- Electronic master monitor and advisory display system, data transmission study [AD-A104243] N82-11064
- Electronic master monitor and advisory display system, human engineering summary report [AD-A104244] N82-11065

DOPPLER RADAR
- Applications of conventional and Doppler radars for aviation safety A82-10215
- An airport wind shear detection and warning system using Doppler radar A82-10220
- Instrumented aircraft verification of clear-air radar detection of low-level wind shear A82-10221
- Detection and display of wind shear and turbulence A82-10222
- Gust front structure observed by Doppler radar A82-10223
- Multiple Doppler radar observations of PBL structure A82-10292

DRAG REDUCTION
- Reductions in parachute drag due to forebody wake effects [AIAA PAPER 81-1939] A82-10417
- The principles and methods for shaping the wing root regions of a wing-body combination at transonic and lower supersonic speeds N82-11016

DRONE AIRCRAFT
- Development of a nylon-Kevlar recovery system for the CL-289 /AN/USD 502/ surveillance drone [AIAA PAPER 81-1952] A82-10427

DROP SIZE
- The dispersion of drop sizes in gas turbine fuel nozzle sprays A82-12107

DROP TESTS
- The constricted rigging line trials technique for assessing the opening characteristics of parachutes [AIAA PAPER 81-1932] A82-10413

DYNAMIC CONTROL
- The need for multivariable design and analysis techniques N82-10049
- An introduction to stochastic optimal control theory N82-11076

DYNAMIC MODELS
- New molding method of three-dimensional hollow photoelastic model and centrifugal stress analysis of air cooled turbine blade model [NAL-TR-427T] N82-11067

DYNAMIC RESPONSE
- Dynamic response of aircraft structure to gun shock loads A82-11314
- A method for determination of the aeroelastic behavior of aircraft with active control systems [DFVLR-FB-81-05] N82-10047
- A preliminary experimental investigation of the response of a turbojet engine to inlet pressure distortion N82-11007

DYNAMIC STABILITY
- A contribution to the stabilization of flight vehicle parachute systems --- mathematical models [ESA-TT-679] N82-10046

DYNAMIC STRUCTURAL ANALYSIS
- Fatigue substantiation of non-linear structures A82-11224
- Emerging technologies in aerospace structures, design, structural dynamics and materials; Proceedings of the Aerospace Conference, San Francisco, CA, August 13-15, 1980 A82-12026
- The Shock and Vibration Digest, volume 13, no. 9 [AD-A105062] N82-10421

E

EARLY WARNING SYSTEMS
- Airborne associative processor /ASPRO/ --- for early warning radar surveillance, command, and control applications [AIAA 81-2145] A82-10104

EARTH OBSERVATIONS (FROM SPACE)
- SARSAT applications A82-12698

EDGE LOADING
- Aeroacoustic theory for noncompact wing-gust interaction [FDRL-81-7] N82-11071

EDUCATION
- Development of aircraft production engineering discipline at IIT, Bombay A82-11317

EFFECTIVE PERCEIVED NOISE LEVELS
- SEL and EPNL noise duration coefficients for the 747 and T-38 aircraft [NASA-TM-83214] N82-11860

EIGENVALUES
- Multivariable design techniques based on singular value generalizations of classical control N82-10051

EJECTION INJURIES
- Development and construction of pilot ejector seats in Germany from 1938-1945 [DFVLR-FB-81-04] N82-10026

EJECTION SEATS
- Development and construction of pilot ejector seats in Germany from 1938-1945 [DFVLR-FB-81-04] N82-10026

ELASTIC DEFORMATION
- On low-speed wind tunnels with deformable boundaries A82-11462

ELECTRIC CHARGE
Electrical ground testing of aircraft antistatic protection A82-10822
ELECTRIC CONTROL
Control of electromechanical actuator elements for flight vehicles --- Russian book A82-12170
ELECTRIC EQUIPMENT TESTS
High voltage surge and partial discharge test to evaluate aerospace equipment parts A82-11740
ELECTRIC FIELDS
Application of numerical methods to the calculation of electrostatic fields in aircraft fuel tanks [AD-A103270] N82-10033
ELECTRIC GENERATORS
A hidden advantage of permanent magnet electrical generating systems A82-11720
ELECTRIC POWER SUPPLIES
Applications of finite element method in aerospace power systems design A82-11717
Advanced aircraft electric power system A82-11718
Variable speed constant frequency /VSCF/ electrical system cuts cost of ownership A82-11719
High voltage surge and partial discharge test to evaluate aerospace equipment parts A82-11740
ELECTRICAL RESISTIVITY
Electrical ground testing of aircraft antistatic protection A82-10822
ELECTRO-OPTICS
Design challenges of high performance aircraft POD EOCM cooling systems --- Electro-Optical/Countermeasure [ASME PAPER 81-ENAS-6] A82-10894
Optical sensors for displacement measurement A82-11407
ELECTROMAGNETIC FIELDS
Antenna theory and design --- Book A82-12323
ELECTROMAGNETIC NOISE
Tangential sensitivity of EW receivers A82-11020
ELECTROMAGNETIC PULSES
System safety program plan --- electromagnetic pulse testing of the A-7E aircraft [AD-A104557] N82-11354
ELECTROMECHANICAL DEVICES
Control of electromechanical actuator elements for flight vehicles --- Russian book A82-12170
ELECTRONIC AIRCRAFT
Design challenges of high performance aircraft POD EOCM cooling systems --- Electro-Optical/Countermeasure [ASME PAPER 81-ENAS-6] A82-10894
ELECTRONIC CONTROL
Advanced aircraft electrical system control technology demonstrator. Phase 1: Requirements analysis and conceptual design [AD-A103922] N82-10326
ELECTRONIC COUNTERMEASURES
Design challenges of high performance aircraft POD EOCM cooling systems --- Electro-Optical/Countermeasure [ASME PAPER 81-ENAS-6] A82-10894
ELECTRONIC TRANSDUCERS
Outsider's look at flight instrumentation [DE81-025409] N82-11066
ELECTRONIC WARFARE
Digital avionics systems - The RAF experience A82-11941
ELECTROSTATICS
Application of numerical methods to the calculation of electrostatic fields in aircraft fuel tanks [AD-A103270] N82-10033
ENERGY CONSERVATION
Fuel conservation - DC-9 series 20/30/40 A82-12563
Cost reduction in air transportation --- energy conservation [SNIAS-811-150-101] N82-10025
ENERGY CONSUMPTION
Characteristics and trends of energy consumption in transport missions with aircraft and surface vehicles A82-10495
Towards minimum power for environmental control in transport aircraft [ASME PAPER 81-ENAS-4] A82-10892
ENERGY CONVERSION EFFICIENCY
A hidden advantage of permanent magnet electrical generating systems A82-11720
ENGINE CONTROL
Helicopter engine technology - With particular reference to the Rolls-Royce Gem engine A82-10304
The digital civil aircraft A82-11938
ENGINE COOLANTS
Air-film cooling returns to ramjets [ASME PAPER 81-ENAS-8] A82-10896
End losses in turbine cascades with porous cooling A82-11434
The enhancement of heat exchange in channels /2nd revised and enlarged edition/ --- Russian book A82-12222
ENGINE DESIGN
Helicopter engine technology - With particular reference to the Rolls-Royce Gem engine A82-10304
Design considerations for duty cycle, life and reliability of small limited life engines [AIAA PAPER 81-1402] A82-10465
Basic problem of aircraft gasturbine engine analytic design. II A82-11463
Thermal expansion accommodation in a jet engine frame A82-11999
Propulsion study for Small Transport Aircraft Technology (STAT) [NASA-CR-165499] N82-10037
Propulsion study for Small Transport Aircraft Technology (STAT), Appendix B [NASA-CR-165499-APP-B] N82-10038
Lightweight diesel engine designs for commuter type aircraft [NASA-CR-165470] N82-11068
Development of multivariable controllers for aircraft turbine engines N82-11087
Integrated analysis of engine [NASA-TM-82713] N82-11491
ENGINE INLETS
A summary of V/STOL inlet analysis methods [NASA-TM-82725] N82-11043
ENGINE MONITORING INSTRUMENTS
Commercial EMS considerations for small gas turbine engines --- automated engine monitoring systems A82-12449
Further application and development of an engine usage/life monitoring system for military services A82-12450
ENGINE NOISE
Rotor wake characteristics relevant to rotor-stator interaction noise generation [AIAA PAPER 81-2031] A82-10456
ENGINE PARTS
Superalloy powder engine components; controls employed to assure high quality hardware A82-12499
Initial experimental research into the response of turbojet engine compressors to distortion of intake pressure N82-11006
ENGINE STARTERS
60 KVA ADP permanent magnet VSCF starter generator system - Generator system performance characteristics A82-11721
ENGINE TESTS
History of flight testing the L-1011 TriStar jet transport. II - Testing highlights since initial certification of the L-1011-1 A82-12049

Propulsion study for Small Transport Aircraft Technology (STAT), Appendix B
[NASA-CR-165499-APP-B] N82-10038
Adaptation of a turbine test facility to high-temperature research
[RAE-LIB-TRANS-2064] N82-11089
ENVIRONMENTAL CONTROL
A new APU for medium place aircraft environmental control systems
[ASME PAPER 81-ENAS-1] A82-10889
Closed loop environmental control systems for fighter aircraft
[ASME PAPER 81-ENAS-2] A82-10890
Towards minimum power for environmental control in transport aircraft
[ASME PAPER 81-ENAS-4] A82-10892
Air-freon integrated environmental conditioning system for trainer subsonic aircraft
[ASME PAPER 81-ENAS-33] A82-10920
ENVIRONMENTAL TESTS
Quantification of the thermal environment for externally carried aircraft stores and ordnance
A82-12100
The Shock and Vibration Digest, volume 13, no. 9
[AD-A105062] N82-10421
EPOXY MATRIX COMPOSITE MATERIALS
Kevlar composites; Proceedings of the Symposium, El Segundo, CA, December 2, 1980
A82-12646
EQUATIONS OF MOTION
Optimal flight paths for winged, supersonic flight vehicles - Extension to the case where thrust can be vectored
A82-10310
On the question of trailing airplane motion
A82-11470
EQUATIONS OF STATE
On computing Floquet transition matrices of rotorcraft
A82-11225
ESTIMATING
New estimation method for flutter or divergence boundary from random responses at subcritical speeds
[NAL-TR-667T] N82-11034
EXHAUST EMISSION
Baseline data on utilization of low-grade fuels in gas turbine applications. Volume 3: Emissions evaluation
[DE81-903764] N82-10254
EXHAUST GASES
Study of reingestion of exhaust gases with different initial temperature in a reversed turbojet engine
A82-11444
EXPANSION
Design of airport pavements for expansive soils
[AD-A104660] N82-11313
EXPERIENCE
Relationships between naval aviation safety and pilot flight experience
A82-11031
EXTERNAL STORES
Quantification of the thermal environment for externally carried aircraft stores and ordnance
A82-12100
EXTRUDING
Superalloy turbine components - Which is the superior manufacturing process, as-HIP, HIP plus Isoforge, or 'gatorizing' of extrusion consolidated billet
A82-12497

F

F-5 AIRCRAFT
F-5G Tigershark
A82-12775
F-18 AIRCRAFT
Variable speed constant frequency /VSCF/ electrical system cuts cost of ownership
A82-11719
FAILURE ANALYSIS
Synchronous fault-tolerant flight control systems
[AIAA 81-2109] A82-10083
Unsolved problems of nickel cadmium batteries
A82-11725
Extending the limits of reliability theory --- Book
A82-12318
Fractographic determination of fatigue crack growth rates in aircraft components
A82-12697
FAN BLADES
Effects of vane/blade ratio and spacing on fan noise
[AIAA PAPER 81-2033] A82-10457
FATIGUE (MATERIALS)
Sophisticated aircraft structure developments - Combat aeroplanes
A82-10309
Fractographic determination of fatigue crack growth rates in aircraft components
A82-12697
FATIGUE LIFE
Acoustic emission - An emerging technology for assessing fatigue damage in aircraft structure
A82-11149
Fatigue life of lugs under service loading - Test results and predictions
A82-11685
FATIGUE TESTS
Superclean superalloy powders by the rotating electrode process
A82-12496
Matrix analysis of wings
N82-10998
FATTY ACIDS
A protective additive for jet fuels
A82-12022
FAULT TOLERANCE
Synchronous fault-tolerant flight control systems
[AIAA 81-2109] A82-10083
FEDERAL BUDGETS
Airport and Airway Improvement Act of 1981, part 1
[GPO-76-241-PT-1] N82-10062
NASA Authorization, 1982: Index
[GPO-84-713] N82-10959
FEEDBACK CONTROL
Closed loop environmental control systems for fighter aircraft
[ASME PAPER 81-ENAS-2] A82-10890
Comparative study of flare control laws
[NASA-CR-164903] N82-10032
Multi-variable analysis and design techniques
[AGARD-LS-117] N82-10048
The need for multivariable design and analysis techniques
N82-10049
Characteristic and principal gains and phases and their use as multivariable control design tools --- generalizing Nyquist and root-locus diagram techniques
N82-10050
Multivariable design techniques based on singular value generalizations of classical control
N82-10051
Limitations on achievable performance of multivariable feedback systems
N82-10052
LQG-based multivariable design: Frequency domain interpretation
N82-10053
LQG multivariable design tools
N82-10054
Design of high integrity multivariable control systems
N82-10055
A geometric approach to multivariable control system synthesis
N82-10056
Multivariables design: The optimization of approximate inverses
N82-10057
Feedback and minimax sensitivity
N82-10058
Design techniques for mutlivariable flight control systems
N82-11078
Practical design and realization of a digital adaptive flight control system
N82-11079
FIBER OPTICS
Optical sensors for displacement measurement
A82-11407
Electronic master monitor and advisory display system, data transmission study
[AD-A104243] N82-11064

FIELD THEORY (PHYSICS)
Antenna theory and design --- Book A82-12323
FIGHTER AIRCRAFT
Analysis of augmented aircraft flying qualities through application of the Neal-Smith criterion [AIAA PAPER 81-1776] A82-10462
Closed loop environmental control systems for fighter aircraft [ASME PAPER 81-ENAS-2] A82-10890
Dynamic response of aircraft structure to gun shock loads A82-11314
The case for a defensive air-to-air fighter A82-12801
FILM COOLING
Air-film cooling returns to ramjets [ASME PAPER 81-ENAS-8] A82-10896
FINITE DIFFERENCE THEORY
Finite difference computation of the steady transonic potential flow around airplanes N82-10981
FINITE ELEMENT METHOD
Applications of finite element method in aerospace power systems design A82-11717
Application of numerical methods to the calculation of electrostatic fields in aircraft fuel tanks [AD-A103270] N82-10033
Calculation of natural modes of vibration for rotor blades by the finite element method [DFVLR-FB-81-07] N82-10452
Structural analysis of fuselages with cutouts by finite element method N82-10995
Structural analysis computer programs for rigid multicomponent pavement structures with discontinuities, WESLIQID and WESLAYER. Report 1: Program development and numerical presentations [AD-A104545] N82-11498
FIRE PREVENTION
Rheological behavior of progressively shear-thickening solutions --- aircraft fuel polymer additives for fire protection in survivable crashes A82-11177
FLEXIBILITY
The effects of flexibility on the steady-state performance of small ribbon parachute models [AIAA PAPER 81-1923] A82-10408
FLEXIBLE SPACECRAFT
Control design of flexible spacecraft N82-11081
FLIGHT CHARACTERISTICS
Analysis of augmented aircraft flying qualities through application of the Neal-Smith criterion [AIAA PAPER 81-1776] A82-10462
Wings in the sun - The evolution of Solar Challenger A82-12694
FLIGHT CONTROL
KC-135 Avionics Modernization Hot Bench [AIAA 81-2105] A82-10081
Synchronous fault-tolerant flight control systems [AIAA 81-2109] A82-10083
The Space Shuttle vehicle checkout involving flight avionics software [AIAA 81-2141] A82-10100
High-efficiency hydraulic power transfer units for multisystem aircraft A82-10853
Developments in boundary layer Thrust Vector Control A82-10855
Control of electromechanical actuator elements for flight vehicles --- Russian book A82-12170
The integrated inertial sensor assembly /IISA/ - A redundant strapdown system for advanced aircraft navigation and flight control functions A82-12642
Development and evaluation of automatic landing control laws for light wing loading STOL aircraft [NASA-CR-166160] N82-10043
Flight trajectory control investigation [AD-A104542] N82-11048
Electronic master monitor and advisory display system, human engineering summary report [AD-A104244] N82-11065
Design considerations for optimal flight control systems N82-11077
Design techniques for multivariable flight control systems N82-11078
Practical design and realization of a digital adaptive flight control system N82-11079
Control law design for transport aircraft flight tasks N82-11080
Management of redundancy in flight control systems using optimal decision theory N82-11084
FLIGHT CREWS
The all digital military aircraft A82-11937
FLIGHT HAZARDS
Downbursts and microbursts - An aviation hazard --- downdrafts beneath thunderstorms A82-10214
Airborne weather radar and severe weather penetration A82-10219
FLIGHT INSTRUMENTS
In-situ calibration of flight heat transfer instrumentation [ASME PAPER 81-ENAS-13] A82-10961
FLIGHT MECHANICS
On the question of trailing airplane motion A82-11470
FLIGHT OPTIMIZATION
Real-time, on-line digital simulation of optimum maneuvers of supersonic aircraft [AIAA 81-2178] A82-10127
Helicopter icing spray system - Improvements and flight experience A82-12696
Optimum climb and descent trajectories for airline missions N82-11082
FLIGHT PATHS
Optimal flight paths for winged, supersonic flight vehicles - Extension to the case where thrust can be vectored A82-10310
FLIGHT SAFETY
Applications of conventional and Doppler radars for aviation safety A82-10215
Detection and display of wind shear and turbulence A82-10222
Test Pilots' Aviation Safety Workshop, U.S. Naval Postgraduate School, Monterey, CA, February 25-28, 1981, Proceedings A82-10500
Relationships between naval aviation safety and pilot flight experience A82-11031
A proposed flight safety program for the Korean Air Force [AD-A102373] N82-10023
FLIGHT SIMULATION
Real-time, on-line digital simulation of optimum maneuvers of supersonic aircraft [AIAA 81-2178] A82-10127
Comparison of simulation and experimental data for a gliding parachute in dynamic flight [AIAA PAPER 81-1924] A82-10409
Ideal and simulated performance of an aircraft in the terrain following mission A82-11302
Fatigue life of lugs under service loading - Test results and predictions A82-11685
FLIGHT TEST INSTRUMENTS
Outsider's look at flight instrumentation [DE81-025409] N82-11066
FLIGHT TESTS
HiMAT onboard flight computer system architecture and qualification [AIAA 81-2107] A82-10082
A microprocessor-based data acquisition system for stall/spin research [AIAA 81-2177] A82-10126

The constricted rigging line trials technique for assessing the opening characteristics of parachutes
[AIAA PAPER 81-1932] A82-10413
Inflatable system for fast deployment of parachutes at low altitudes from slow moving aircraft or stationary supports
[AIAA PAPER 81-1953] A82-10428
Dynamic response of aircraft structure to gun shock loads
A82-11314
History of flight testing the L-1011 TriStar jet transport. II - Testing highlights since initial certification of the L-1011-1
A82-12049
FAA acceptance tests on the NAVSTAR GPS Z-Set receiver
A82-12639
Ring Laser Gyro Navigator /RLGN/ flight test results
A82-12644
Flight test results of the model simulation controller for the HFB 320 for in-flight simulation of the A310 airbus
[ESA-TT-660] N82-10107

FLIGHT TRAINING
Spin recovery training --- licensing requirement
[GPO-66-020] N82-10022

FLOORS
Evaluation of the acoustic measurement capability of the NASA Langley V/STOL wind tunnel open test section with acoustically absorbent ceiling and floor treatments
[NASA-CR-165796] N82-10059

FLOQUET THEOREM
On computing Floquet transition matrices of rotorcraft
A82-11225
Numerical treatment of helicopter rotor stability problems
A82-12045

FLOW DISTORTION
On evaluating the influence of local disruptions of flow over trailing edge and leading edge flaps from the data of wind tunnel tests of a rectangular wing segment
A82-11465
Amplified crossflow disturbances in the laminar boundary layer on swept wings with suction
[NASA-TP-1902] N82-11391

FLOW DISTRIBUTION
On the prediction of swirling flowfields found in axisymmetric combustor geometries
A82-12120
Second order approximation theory of an arbitrary aerofoil in compressible potential flow
N82-10982
An aerodynamic design method for transonic axial flow compressor stage
N82-10984
A comparison of theoretical and experimental pressure distributions for two advanced fighter wings
[NASA-TM-81331] N82-11054

FLOW EQUATIONS
Computation of high Reynolds number internal/external flows
[NASA-TM-84049] N82-11046

FLOW GEOMETRY
Thermal and flow analysis of a convection, air-cooled ceramic coated porous metal concept for turbine vanes
[ASME PAPER 81-GT-48] A82-10952

FLOW VISUALIZATION
Experimental study of subsonic and transonic flows past a wing
A82-10363
Effects of vortex flaps on the low-speed aerodynamic characteristics of an arrow wing
[NASA-TP-1914] N82-11013

FLOWMETERS
Advanced fuel flowmeter for future naval aircraft
[AD-A104364] N82-11063

FLUID DYNAMICS
V/STOL aircraft and fluid dynamics
[NASA-TM-81328] N82-10029

FLUID POWER
Fluid power technology for the '80s --- Book
A82-10851

FLUIDIC CIRCUITS
Considerations and applications for the use of fluidics in aerospace controls
A82-12087

FLUTTER
New estimation method for flutter or divergence boundary from random responses at subcritical speeds
[NAL-TR-667T] N82-11034

FLUTTER ANALYSIS
Experimental study of empennage snap-through vibrations
A82-11471
An influence coefficient method for the application of the modal technique to wing flutter suppression of the DAST ARW-1 wing
[NASA-CR-165772] N82-11070

FLY BY WIRE CONTROL
Flight test results of the model simulation controller for the HFB 320 for in-flight simulation of the A310 airbus
[ESA-TT-660] N82-10107

FLYING PLATFORMS
Parametric study of microwave-powered high-altitude airplane platforms designed for linear flight
[NASA-TP-1918] N82-11050

FLYWHEELS
Low maintenance hydraulic accumulator
[AD-A103947] N82-10034

FOREBODIES
Reductions in parachute drag due to forebody wake effects
[AIAA PAPER 81-1939] A82-10417

FOREIGN BODIES
Coupled fluid/structure response predictions for soft body impact of airfoil configurations --- ice and bird impact on aircraft engines
A82-12039

FOSSIL FUELS
Baseline data on utilization of low-grade fuels in gas turbine applications. Volume 3: Emissions evaluation
[DE81-903764] N82-10254

FOUNDATIONS
Design of airport pavements for expansive soils
[AD-A104660] N82-11313

FRACTOGRAPHY
Fractographic determination of fatigue crack growth rates in aircraft components
A82-12697

FRACTURE STRENGTH
The application of improved aluminium alloys and steels in aircraft structures
A82-10305

FRAMES
Thermal expansion accommodation in a jet engine frame
A82-11999

FREE FLOW
Multiple-scale turbulence modeling of free turbulent flows
[ASME PAPER 81-FE-20] A82-10934

FREON
Air-freon integrated environmental conditioning system for trainer subsonic aircraft
[ASME PAPER 81-ENAS-33] A82-10920

FREQUENCY STABILITY
60 KVA ADP permanent magnet VSCF starter generator system - Generator system performance characteristics
A82-11721

FRONTS (METEOROLOGY)
Gust front structure observed by Doppler radar
A82-10223

FUEL CONSUMPTION
Helicopter engine technology - With particular reference to the Rolls-Royce Gem engine
A82-10304
Characteristics and trends of energy consumption in transport missions with aircraft and surface vehicles
A82-10495
A hidden advantage of permanent magnet electrical generating systems
A82-11720
Fuel conservation - DC-9 series 20/30/40
A82-12563

FUEL CORROSION
A protective additive for jet fuels
A82-12022
FUEL GAGES
Advanced fuel flowmeter for future naval aircraft
[AD-A104364] N82-11063
FUEL PRODUCTION
Fuel for future transport aircraft
[ASME PAPER 81-HT-80] A82-10965
FUEL SPRAYS
The dispersion of drop sizes in gas turbine fuel nozzle sprays
A82-12107
FUEL TANKS
Application of numerical methods to the calculation of electrostatic fields in aircraft fuel tanks
[AD-A103270] N82-10033
FUSELAGES
Experimental modal analysis of the fuselage panels of an Aero Commander aircraft
[NASA-CR-165750] N82-10028
Structural analysis of fuselages with cutouts by finite element method
N82-10995

G

GAS COOLING
A new method of cooling turbine vanes
N82-11027
GAS FLOW
Theoretical investigations and experimental researches for higher subsonic two-dimensional compressor cascade
N82-11024
GAS TEMPERATURE
Study of reingestion of exhaust gases with different initial temperature in a reversed turbojet engine
A82-11444
GAS TURBINE ENGINES
Design considerations for duty cycle, life and reliability of small limited life engines
[AIAA PAPER 81-1402] A82-10465
A new APU for medium place aircraft environmental control systems
[ASME PAPER 81-ENAS-1] A82-10889
End losses in turbine cascades with porous cooling
A82-11434
Basic problem of aircraft gasturbine engine analytic design. II
A82-11463
The CIVIC - A concept in vortex induced combustion. II
[ASME PAPER 81-GT-12] A82-11997
Thermal expansion accommodation in a jet engine frame
A82-11999
The dispersion of drop sizes in gas turbine fuel nozzle sprays
A82-12107
Application of numerical modeling to gas turbine combustor development problems
A82-12118
Validation studies of turbulence and combustion models for aircraft gas turbine combustors
A82-12267
Commercial EMS considerations for small gas turbine engines --- automated engine monitoring systems
A82-12449
Further application and development of an engine usage/life monitoring system for military services
A82-12450
Superclean superalloy powders by the rotating electrode process
A82-12496
Lineup of the LM-series aircraft-derivative gas turbines
A82-12560
Development of low modulus material for use in ceramic gas path seal applications
[NASA-CR-165469] N82-10039
Baseline data on utilization of low-grade fuels in gas turbine applications. Volume 3: Emissions evaluation
[DE81-903764] N82-10254
A new method of cooling turbine vanes
N82-11027
GAUSS EQUATION
LQG-based multivariable design: Frequency domain interpretation
N82-10053
LQG multivariable design tools
N82-10054
GENERAL AVIATION AIRCRAFT
A new APU for medium place aircraft environmental control systems
[ASME PAPER 81-ENAS-1] A82-10889
Icing tunnel test of a glycol-exuding porous leading edge ice protection system on a general aviation airfoil --- conducted in the Lewis Research Center icing research tunnel
[NASA-CR-165444] N82-10021
General aviation aircraft antennas for the global positioning system
[NASA-TM-83212] N82-11339
GEOMETRY
A solution to the static geometry problem for JTIDS relative navigation
A82-12634
The statistical theory of radio direction finding
[AD-A104156] N82-10027
A geometric approach to multivariable control system synthesis
N82-10056
Aerodynamic calculations and design of subcritical aerofoils
N82-10983
GLASS FIBER REINFORCED PLASTICS
On the use of carbon composites in slat and stabilizer construction
A82-11468
GLIDING
Comparison of simulation and experimental data for a gliding parachute in dynamic flight
[AIAA PAPER 81-1924] A82-10409
GLOBAL POSITIONING SYSTEM
National Aerospace Meeting, Trevose, PA, April 8-10, 1981, Proceedings
A82-12626
Satellite geometry considerations for low cost GPS user equipment
A82-12630
FAA acceptance tests on the NAVSTAR GPS Z-Set receiver
A82-12639
A navigation systems planning model
A82-12640
Integrated satellite navigation and strapdown attitude and heading reference systems for civil air carriers
A82-12643
General aviation aircraft antennas for the global positioning system
[NASA-TM-83212] N82-11339
GROUND BASED CONTROL
HiMAT onboard flight computer system architecture and qualification
[AIAA 81-2107] A82-10082
GROUND TESTS
Electrical ground testing of aircraft antistatic protection
A82-10822
GUATEMALA
Radar mapping, archaeology, and ancient land use in the Maya lowlands
[NASA-CR-164931] N82-11514
GUIDANCE SENSORS
The integrated inertial sensor assembly /IISA/ - A redundant strapdown system for advanced aircraft navigation and flight control functions
A82-12642
GUNFIRE
Dynamic response of aircraft structure to gun shock loads
A82-11314
GUST LOADS
Crack growth evaluation of a method to convert real-time loads history to a simplified engineering spectra --- for aircraft structural analysis
A82-12043
Aeroacoustic theory for noncompact wing-gust interaction
[FDRL-81-7] N82-11071

GUSTS
- Gust front structure observed by Doppler radar A82-10223

GYROCOMPASSES
- Fast and accurate gyrocompass using strapdown tuned rotor gyros as a solution to combat helicopters navigation problems A82-11927

GYROSCOPES
- Problems relating to the classical rate-gyro A82-10497
- Design and development of a low cost servoed rate gyro for unmanned aircraft A82-11932

GYROSTABILIZERS
- Synthesis of system for evaluating gyrostabilizer state with unknown disturbances A82-11469

H

HARDWARE
- Controlling the software/hardware interface for the validation of avionics systems --- in flight control systems [AIAA 81-2159] A82-10116

HEAD-UP DISPLAYS
- Study and development of an integrated head-up display [AD-A104337] N82-11062

HEAT EXCHANGERS
- The enhancement of heat exchange in channels /2nd revised and enlarged edition/ --- Russian book A82-12222
- A new method of cooling turbine vanes N82-11027

HEAT RESISTANT ALLOYS
- Powder metallurgy superalloys - Aerospace materials for the 1980's; Proceedings of the Conference, Zurich, Switzerland, November 18-20, 1980. Volume 1 A82-12495
- Superclean superalloy powders by the rotating electrode process A82-12496
- Superalloy turbine components - Which is the superior manufacturing process, as-HIP, HIP plus Isoforge, or 'gatorizing' of extrusion consolidated billet A82-12497
- Superalloy powder engine components; controls employed to assure high quality hardware A82-12499

HEAT TRANSFER
- In-situ calibration of flight heat transfer instrumentation [ASME PAPER 81-ENAS-13] A82-10901
- Thermal and flow analysis of a convection, air-cooled ceramic coated porous metal concept for turbine vanes [ASME PAPER 81-HT-48] A82-10952
- Results of experimental study of heat transfer to turbine blades with porous cooling A82-11446

HEAT TRANSMISSION
- The enhancement of heat exchange in channels /2nd revised and enlarged edition/ --- Russian book A82-12222

HEATING EQUIPMENT
- Ice protection system technology N82-11060
- Experimental study of fuel heating at low temperatures in a wing tank model, volume 1 [NASA-CR-165391] N82-11224

HELICOPTER CONTROL
- Electronic master monitor and advisory display system, data transmission study [AD-A104243] N82-11064
- Electronic master monitor and advisory display system, human engineering summary report [AD-A104244] N82-11065

HELICOPTER DESIGN
- An investigation of a stoppable helicopter rotor with circulation control --- ames 40 by 80 foot wind tunnel [NASA-TM-81218] N82-10030

HELICOPTER ENGINES
- Helicopter engine technology - With particular reference to the Rolls-Royce Gem engine A82-10304

HELICOPTER PERFORMANCE
- Helicopter rotor trailing edge noise [AIAA PAPER 81-2001] A82-10455
- Numerical treatment of helicopter rotor stability problems A82-12045
- Helicopter icing spray system - Improvements and flight experience A82-12696

HELICOPTERS
- Model helicopter rotor impulsive noise A82-11300
- A comprehensive bibliography of literature on helicopter noise technology [AD-A103331] N82-10812
- Rotorcraft icing: Status and prospects [AGARD-AR-166] N82-11056
- Helicopter rotor trailing edge noise --- noise prediction [NASA-CR-3470] N82-11859

HFB-320 AIRCRAFT
- System identification of the longitudinal motion of the DFVLR HFB 320 research aircraft with particular consideration of control surface effectiveness [ESA-TT-666] N82-10045
- Flight test results of the model simulation controller for the HFB 320 for in-flight simulation of the A310 airbus [ESA-TT-660] N82-10107

HIGH ALTITUDE BALLOONS
- A new thermal and trajectory model for high altitude balloons [AIAA PAPER 81-1926] A82-10411

HIGH POLYMERS
- Rheological behavior of progressively shear-thickening solutions --- aircraft fuel polymer additives for fire protection in survivable crashes A82-11177

HIGH STRENGTH STEELS
- The application of improved aluminium alloys and steels in aircraft structures A82-10305

HIGH TEMPERATURE RESEARCH
- Adaptation of a turbine test facility to high-temperature research [RAE-LIB-TRANS-2064] N82-11089

HIGH VOLTAGES
- High voltage surge and partial discharge test to evaluate aerospace equipment parts A82-11740

HONEYCOMB STRUCTURES
- Light aircraft structural design in non-metallics - Use of composite honeycomb for light aircraft A82-10308

HORIZONTAL FLIGHT
- Analysis of augmented aircraft flying qualities through application of the Neal-Smith criterion [AIAA PAPER 81-1776] A82-10462
- Parametric study of microwave-powered high-altitude airplane platforms designed for linear flight [NASA-TP-1918] N82-11050

HORIZONTAL TAIL SURFACES
- A CFRP taileron for the Tornado: Construction and production --- horizontal stabilizer [MBB-FE-212/KFK/PUB/2] N82-10035

HUBS
- Development of the Triflex rotor head A82-11222

HUMAN FACTORS ENGINEERING
- Electronic master monitor and advisory display system, human engineering summary report [AD-A104244] N82-11065

HUMAN PERFORMANCE
- Relationships between naval aviation safety and pilot flight experience A82-11031

HUMAN REACTIONS
- Effects of aircraft noise on the equilibrium of airport residents: Testing and utilization of a new methodology [NASA-TM-76628] N82-11636

HYDRAULIC CONTROL
High-efficiency hydraulic power transfer units for multisystem aircraft
A82-10853
HYDRAULIC EQUIPMENT
Fluid power technology for the '80s --- Book
A82-10851
Low maintenance hydraulic accumulator
[AD-A103947] N82-10034
Aircraft digital input controlled hydraulic actuation and control system
[AD-A104263] N82-11072
HYDROCARBON FUEL PRODUCTION
Jet fuel from carbon
A82-12021
Jet fuel locks to shale oil: The 1980 technology review
[AD-A104414] N82-11228
HYDROGEN FUELS
Fuel for future transport aircraft
[ASME PAPER 81-HT-80] A82-10965
HYDROGENATION
Jet fuel from carbon
A82-12021

I

ICE FORMATION
Helicopter icing spray system - Improvements and flight experience
A82-12696
Selected bibliography of NACA-NASA aircraft icing publications
[NASA-TM-81651] N82-11053
Rotorcraft icing: Status and prospects
[AGARD-AR-166] N82-11056
Operational environment, meteorological conditions and weather forecasting
N82-11057
Technology base for icing instrumentation and mathematical modelling
N82-11058
Facilities for development and clearance
N82-11059
Ice protection system technology
N82-11060
Proposed standard requirements and procedures for icing clearance
N82-11061
ICE PREVENTION
Icing tunnel test of a glycol-exuding porous leading edge ice protection system on a general aviation airfoil --- conducted in the Lewis Research Center icing research tunnel
[NASA-CR-165444] N82-10021
Icing tunnel tests of a composite porous leading edge for use with a liquid anti-ice system --- Lewis icing research tunnel
[NASA-CR-164966] N82-11052
Selected bibliography of NACA-NASA aircraft icing publications
[NASA-TM-81651] N82-11053
IMAGE ENHANCEMENT
Solution to the hidden-line problem
A82-12803
IMPACT ACCELERATION
Limiting payload deceleration during ground impact
[AIAA PAPER 81-1916] A82-10404
IMPACT DAMAGE
Impact-initiated damage thresholds in composites
A82-12026
IMPACT LOADS
Coupled fluid/structure response predictions for soft body impact of airfoil configurations --- ice and bird impact on aircraft engines
A82-12039
IMPACT RESISTANCE
Seven years experience with Kevlar-49 in the Lockheed L-1011 Tristar
A82-12647
IMPACT TESTS
Air bag impact attenuation system for the AQM-34V remote piloted vehicle
[AIAA PAPER 81-1917] A82-10403
IN-FLIGHT MONITORING
Performance analysis of enroute air traffic control computers in the National Airspace System
[AIAA 81-2203] A82-10140
Commercial EMS considerations for small gas turbine engines --- automated engine monitoring systems
A82-12449
Further application and development of an engine usage/life monitoring system for military services
A82-12450
Electronic master monitor and advisory display system, data transmission study
[AD-A104243] N82-11064
Electronic master monitor and advisory display system, human engineering summary report
[AD-A104244] N82-11065
INCOMPRESSIBLE FLOW
Theoretical analysis of parachute inflation including fluid kinetics
[AIAA PAPER 81-1925] A82-10410
Second order approximation theory of an arbitrary aerofoil in compressible potential flow
N82-10982
INCOMPRESSIBLE FLUIDS
Calculation of aerodynamic characteristics of jet flapped airplane
A82-11459
INDEXES (DOCUMENTATION)
NASA Authorization, 1982: Index
[GPO-84-713] N82-10959
INERTIAL NAVIGATION
Synthesis of system for evaluating gyrostabilizer state with unknown disturbances
A82-11469
Ring Laser Gyro Navigator /RLGN/ flight test results
A82-12644
INERTIAL REFERENCE SYSTEMS
Integrated satellite navigation and strapdown attitude and heading reference systems for civil air carriers
A82-12643
INFLATABLE STRUCTURES
Inflatable system for fast deployment of parachutes at low altitudes from slow moving aircraft or stationary supports
[AIAA PAPER 81-1953] A82-10428
INFLATING
Theoretical analysis of parachute inflation including fluid kinetics
[AIAA PAPER 81-1925] A82-10410
The constricted rigging line trials technique for assessing the opening characteristics of parachutes
[AIAA PAPER 81-1932] A82-10413
Stress measurements in a ribbon parachute canopy during inflation and at steady state
[AIAA PAPER 81-1944] A82-10420
INJECTORS
One reason for the onset of high-frequency self-excited oscillations --- in combustion chambers of aircraft engines
A82-11448
INLET FLOW
A theoretical analysis of the stream surface of revolution with supersonic inlet flow in a transonic axial compressor
N82-11025
A summary of V/STOL inlet analysis methods
[NASA-TM-82725] N82-11043
INLET PRESSURE
Initial experimental research into the response of turbojet engine compressors to distortion of intake pressure
N82-11006
A preliminary experimental investigation of the response of a turbojet engine to inlet pressure distortion
N82-11007
INSPECTION
Mathematical model for the maintenance program of modern jet aircraft --- crack detection; inspection intervals
[DFVLR-FB-81-14] N82-10002
INSTRUMENT LANDING SYSTEMS
Discrete address beacon, navigation and landing system
A82-10650
INTAKE SYSTEMS
Initial experimental research into the response of turbojet engine compressors to distortion of intake pressure
N82-11006

INTEGRAL EQUATIONS
A study on numerical method for evaluating spanwise integral in subsonic lifting-surface theory
[NAL-TR-661T] N82-11035

INTELLIGENCE
Interoperability testing of decentralized command, control, communications and intelligence /C3I/ systems
[AIAA 81-2205] A82-10143

INTERPOLATION
Feedback and minimax sensitivity
N82-10058

INVERSIONS
The net-skirt to a parachute canopy as a device to prevent inversion
[AIAA PAPER 81-1927] A82-10412

INVISCID FLOW
Theoretical analysis of parachute inflation including fluid kinetics
[AIAA PAPER 81-1925] A82-10410
The arbitrary quasi-orthogonal surface method for computing three-dimensional flow in turbine machinery. 2. Calculation of the three-dimensional flow with the S sub 1-surface twisted
N82-11015

J

JAGUAR AIRCRAFT
Digital avionics systems - The RAF experience
A82-11941

JET AIRCRAFT
Calculation of aerodynamic characteristics of jet flapped airplane
A82-11459
History of flight testing the L-1011 TriStar jet transport. II - Testing highlights since initial certification of the L-1011-1
A82-12049

JET AIRCRAFT NOISE
SEL and EPNL noise duration coefficients for the 747 and T-38 aircraft
[NASA-TM-83214] N82-11860

JET ENGINE FUELS
Fuel for future transport aircraft
[ASME PAPER 81-HT-80] A82-10965
Jet fuel from carbon
A82-12021
A protective additive for jet fuels
A82-12022
Experimental study of fuel heating at low temperatures in a wing tank model, volume 1
[NASA-CR-165391] N82-11224
Jet fuel locks to shale oil: The 1980 technology review
[AD-A104414] N82-11228
An assessment of the use of antimisting fuel in turbofan engines
[NASA-CR-165258] N82-11230

JET ENGINES
Thermal expansion accommodation in a jet engine frame
A82-11999
Coupled fluid/structure response predictions for soft body impact of airfoil configurations --- ice and bird impact on aircraft engines
A82-12039

JET FLAPS
Calculation of aerodynamic characteristics of jet flapped airplane
A82-11459

JET IMPINGEMENT
Study of reingestion of exhaust gases with different initial temperature in a reversed turbojet engine
A82-11444

JET VANES
Effects of vane/blade ratio and spacing on fan noise
[AIAA PAPER 81-2033] A82-10457

K

KERNEL FUNCTIONS
On the kernel function collocation method in steady subsonic flow for wing with control surfaces
N82-12023

KEVLAR (TRADEMARK)
Kevlar composites; Proceedings of the Symposium, El Segundo, CA, December 2, 1980
A82-12646
Seven years experience with Kevlar-49 in the Lockheed L-1011 Tristar
A82-12647

KINEMATICS
Analytical determination of undercarriage retraction kinematics
A82-10364

KOREA
A proposed flight safety program for the Korean Air Force
[AD-A102373] N82-10023

L

L-1011 AIRCRAFT
History of flight testing the L-1011 TriStar jet transport. II - Testing highlights since initial certification of the L-1011-1
A82-12049
Seven years experience with Kevlar-49 in the Lockheed L-1011 Tristar
A82-12647

LAMINAR BOUNDARY LAYER
Amplified crossflow disturbances in the laminar boundary layer on swept wings with suction
[NASA-TP-1902] N82-11391

LAMINAR FLOW
On low-speed wind tunnels with deformable boundaries
A82-11462

LAMINATES
Impact-initiated damage thresholds in composites
A82-12028

LAND USE
Radar mapping, archaeology, and ancient land use in the Maya lowlands
[NASA-CR-164931] N82-11514

LANDING AIDS
Comparative study of flare control laws
[NASA-CR-164903] N82-10032

LANDING GEAR
The possibility of using deformable rubber components in landing gear
A82-10496

LASER GYROSCOPES
Ring Laser Gyro Navigator /RLGN/ flight test results
A82-12644

LATERAL CONTROL
Procedures and analysis techniques for determining static air minimum control speeds
A82-12564

LEAD ACID BATTERIES
Sealed lead-acid batteries for aircraft applications
A82-11716

LEADING EDGE SLATS
On evaluating the influence of local disruptions of flow over trailing edge and leading edge flaps from the data of wind tunnel tests of a rectangular wing segment
A82-11465
On the use of carbon composites in slat and stabilizer construction
A82-11468

LEADING EDGES
Icing tunnel test of a glycol-exuding porous leading edge ice protection system on a general aviation airfoil --- conducted in the Lewis Research Center icing research tunnel
[NASA-CR-165444] N82-10021
Icing tunnel tests of a composite porous leading edge for use with a liquid anti-ice system --- Lewis icing research tunnel
[NASA-CR-164966] N82-11052

LICENSING
Spin recovery training --- licensing requirement
[GPO-66-020] N82-10022

LIFE CYCLE COSTS
Closed loop environmental control systems for fighter aircraft
[ASME PAPER 81-ENAS-2] A82-10890
Variable speed constant frequency /VSCF/ electrical system cuts cost of ownership
A82-11719
A hidden advantage of permanent magnet electrical generating systems
A82-11720

LIFE SUPPORT SYSTEMS
Air supply system bite for Boeing 767 airplane --- Built-In-Test-Equipment [ASME PAPER 81-ENAS-7] A82-10895
LIFT
A study on numerical method for evaluating spanwise integral in subsonic lifting-surface theory [NAL-TR-661T] N82-11035
LIFT AUGMENTATION
An investigation of a stoppable helicopter rotor with circulation control --- ames 40 by 80 foot wind tunnel [NASA-TM-81218] N82-10030
LIFT DRAG RATIO
A modular asymmetric parachute for wind tunnel testing [AIAA PAPER 81-1933] A82-10414
Increasing the lift:drag ratio of a flat delta wing A82-11899
LIFTING BODIES
Development of new lifting parachute designs with increased trim angle [AIAA PAPER 81-1921] A82-10407
A modular asymmetric parachute for wind tunnel testing [AIAA PAPER 81-1933] A82-10414
LIGHT AIRCRAFT
Some possibilities for composite light aircraft construction A82-10307
Light aircraft structural design in non-metallics - Use of composite honeycomb for light aircraft A82-10308
The possibility of using deformable rubber components in landing gear A82-10496
Experimental modal analysis of the fuselage panels of an Aero Commander aircraft [NASA-CR-165750] N82-10028
LIGHTNING
Lightning effects on aircraft and composites. Literature study on lightning strikes and protection --- advanced composite materials [FOA-C-20388-F9] N82-10024
LINEAR EQUATIONS
LQG-based multivariable design: Frequency domain interpretation N82-10053
LQG multivariable design tools N82-10054
LINEAR SYSTEMS
Limitations on achievable performance of multivariable feedback systems N82-10052
Design of high integrity multivariable control systems N82-10055
A geometric approach to multivariable control system synthesis N82-10056
Multivariables design: The optimization of approximate inverses N82-10057
Feedback and minimax sensitivity N82-10058
Theory of stochastic optimal control some basic notions N82-11075
LIQUID HYDROGEN
Fuel for future transport aircraft [ASME PAPER 81-HT-80] A82-10965
LOAD TESTS
Fatigue life of lugs under service loading - Test results and predictions A82-11685
LONGITUDINAL CONTROL
System identification of the longitudinal motion of the DFVLR HFB 320 research aircraft with particular consideration of control surface effectiveness [ESA-TT-666] N82-10045
LONGITUDINAL STABILITY
Active control elements on the transonic wing of the Airbus A-300 (ACTTA A). Airbus A-300 with reduced longitudinal stability (ACTTA-C) --- advanced control transonic transport aircraft (ACCTA): design considerations N82-10044
LOOPS
The need for multivariable design and analysis techniques N82-10049
Multivariable design techniques based on singular value generalizations of classical control N82-10051
Limitations on achievable performance of multivariable feedback systems N82-10052
LQG-based multivariable design: Frequency domain interpretation N82-10053
LQG multivariable design tools N82-10054
Design of high integrity multivariable control systems N82-10055
LOW ALTITUDE
Inflatable system for fast deployment of parachutes at low altitudes from slow moving aircraft or stationary supports [AIAA PAPER 81-1953] A82-10428
LOW SPEED STABILITY
Effects of vortex flaps on the low-speed aerodynamic characteristics of an arrow wing [NASA-TP-1914] N82-11013
Wind-tunnel results for a modified 17-percent-thick low-speed airfoil section [NASA-TP-1919] N82-11033
LOW SPEED WIND TUNNELS
On low-speed wind tunnels with deformable boundaries A82-11462
On evaluating the influence of local disruptions of flow over trailing edge and leading edge flaps from the data of wind tunnel tests of a rectangular wing segment A82-11465
LOW TEMPERATURE ENVIRONMENTS
Experimental study of fuel heating at low temperatures in a wing tank model, volume 1 [NASA-CR-165391] N82-11224
LUGS
Fatigue life of lugs under service loading - Test results and predictions A82-11685

M

MAGNETS
A hidden advantage of permanent magnet electrical generating systems A82-11720
60 KVA ADP permanent magnet VSCF starter generator system - Generator system performance characteristics A82-11721
MAN MACHINE SYSTEMS
Improving the MLS through enhanced cockpit displays A82-10649
MANUAL CONTROL
Improving the MLS through enhanced cockpit displays A82-10649
Control law design for transport aircraft flight tasks N82-11080
MASS DISTRIBUTION
Experimental determination of parachute apparent mass and its significance in predicting dynamic stability [AIAA PAPER 81-1920] A82-10406
MATCHING
Strong matching method for computing transonic viscous flows including wakes and separations - Lifting airfoils A82-10021
MATERIALS TESTS
The possibility of using deformable rubber components in landing gear A82-10496
MATHEMATICAL MODELS
A mathematical model of an over-sea airborne UHF radio link A82-11406
Validation studies of turbulence and combustion models for aircraft gas turbine combustors A82-12267

Mathematical model for the maintenance program of modern jet aircraft --- crack detection; inspection intervals
[DFVLR-FB-81-14] N82-10002
A contribution to the stabilization of flight vehicle parachute systems --- mathematical models
[ESA-TT-679] N82-10046
Technology base for icing instrumentation and mathematical modelling
N82-11058
Aeroacoustic theory for noncompact wing-gust interaction
[FDRL-81-7] N82-11071
Integrated analysis of engine
[NASA-TM-82713] N82-11491
Structural analysis computer programs for rigid multicomponent pavement structures with discontinuities, WESLIQID and WESLAYER. Report 1: Program development and numerical presentations
[AD-A104545] N82-11498

MATRICES (MATHEMATICS)
On computing Floquet transition matrices of rotorcraft
A82-11225

MATRIX METHODS
The automatic matrix force method and techniques for handling more complex computations with given computer capacity
N82-10994

MAXWELL EQUATION
Antenna theory and design --- Book
A82-12323

MEASURING INSTRUMENTS
Technology base for icing instrumentation and mathematical modelling
N82-11058

MECHANICAL DEVICES
A comprehensive bibliography of literature on helicopter noise technology
[AD-A103331] N82-10812

MECHANICAL PROPERTIES
Superalloy turbine components - Which is the superior manufacturing process, as-HIP, HIP plus Isoforge, or 'gatorizing' of extrusion consolidated billet
A82-12497
Superalloy powder engine components; controls employed to assure high quality hardware
A82-12499

METAL FATIGUE
Fatigue substantiation of non-linear structures
A82-11224
A note on fatal aircraft accidents involving metal fatigue
A82-11400

METAL POWDER
Superclean superalloy powders by the rotating electrode process
A82-12496

METALLIZING
Electrical ground testing of aircraft antistatic protection
A82-10822

METEOROLOGICAL PARAMETERS
Rotorcraft icing: Status and prospects
[AGARD-AR-166] N82-11056
Operational environment, meteorological conditions and weather forecasting
N82-11057

METEOROLOGICAL RADAR
Applications of conventional and Doppler radars for aviation safety
A82-10215
Description of the meteorological research radar system aboard NOAA/Research Facilities Center WP-3D aircraft
A82-10217
Airborne weather radar and severe weather penetration
A82-10219
An airport wind shear detection and warning system using Doppler radar
A82-10220
Instrumented aircraft verification of clear-air radar detection of low-level wind shear
A82-10221
The evolution of airborne weather avoidance radar toward a calibrated remote rain gauge using REACT --- Rain Echo Attenuation Compensation Hardware
A82-10225

METEOROLOGICAL RESEARCH AIRCRAFT
Description of the meteorological research radar system aboard NOAA/Research Facilities Center WP-3D aircraft
A82-10217

MEXICO
Radar mapping, archaeology, and ancient land use in the Maya lowlands
[NASA-CR-164931] N82-11514

MICROMETEOROLOGY
Downbursts and microbursts - An aviation hazard --- downdrafts beneath thunderstorms
A82-10214

MICROPROCESSORS
A microprocessor-based data acquisition system for stall/spin research
[AIAA 81-2177] A82-10126
Navigation task partitioning in distributed-processing avionics systems
A82-10646

MICROWAVE LANDING SYSTEMS
Improving the MLS through enhanced cockpit displays
A82-10649

MICROWAVE TRANSMISSION
Parametric study of microwave-powered high-altitude airplane platforms designed for linear flight
[NASA-TP-1918] N82-11050

MILITARY AIRCRAFT
Automated Paint and Process Line /APPL/ --- for aircraft production
[AIAA 81-2166] A82-10120
Sophisticated aircraft structure developments - Combat aeroplanes
A82-10309
Sealed lead-acid batteries for aircraft applications
A82-11716
Advanced aircraft electric power system
A82-11718
The all digital military aircraft
A82-11937
ACMA - Fact or fantasy --- Advanced Civilian/Military Aircraft
A82-12048
Further application and development of an engine usage/life monitoring system for military services
A82-12450

MILITARY AVIATION
Relationships between naval aviation safety and pilot flight experience
A82-11031

MILITARY HELICOPTERS
Fast and accurate gyrocompass using strapdown tuned rotor gyros as a solution to combat helicopters navigation problems
A82-11927

MILITARY OPERATIONS
The case for a defensive air-to-air fighter
A82-12801

MILITARY TECHNOLOGY
Implementation of AVRADCOM MMST --- for military aircraft parts production engineering
A82-10545
The all digital military aircraft
A82-11937
Digital avionics systems - The RAF experience
A82-11941
Parachute technology under pressure
A82-12804

MINICOMPUTERS
The use of the Weber method for minicomputer-assisted numerical analysis of airfoils
A82-10362

MINIMAX TECHNIQUE
Feedback and minimax sensitivity
N82-10058

MISSILE BODIES
Nonlinear prediction of subsonic aerodynamic loads on wings and bodies at high angles of attack
A82-11359

MISSILE DESIGN
Design considerations for duty cycle, life and reliability of small limited life engines
[AIAA PAPER 81-1402] A82-10465

Outsider's look at flight instrumentation [DE81-025409] N82-11066

MOLDS
New molding method of three-dimensional hollow photoelastic model and centrifugal stress analysis of air cooled turbine blade model [NAL-TR-427T] N82-11067

MONOPLANES
Analytical determination of undercarriage retraction kinematics A82-10364

MRCA AIRCRAFT
A CFRP taileron for the Tornado: Construction and production --- horizontal stabilizer [MBB-FE-212/KPK/PUB/2] N82-10035

MULTIENGINE VEHICLES
Procedures and analysis techniques for determining static air minimum control speeds A82-12564

MULTIPROCESSING (COMPUTERS)
Airborne associative processor /ASPRO/ --- for early warning radar surveillance, command, and control applications [AIAA 81-2145] A82-10104
Navigation task partitioning in distributed-processing avionics systems A82-10646

N

NACELLES
Low speed testing of the inlets designed for a tandem-fan V/STOL nacelle --- conducted in the Lewis 10 by 10 foot wind tunnel [NASA-TM-82728] N82-11042

NASA PROGRAMS
NASA Authorization, 1982: Index [GPO-84-713] N82-10959

NATIONAL AIRSPACE UTILIZATION SYSTEM
Performance analysis of enroute air traffic control computers in the National Airspace System [AIAA 81-2203] A82-10140

NATIONAL AVIATION SYSTEM
Airport and Airway Improvement Act of 1981, part 1 [GPO-76-241-PT-1] N82-10062

NAVIER-STOKES EQUATION
Computation of high Reynolds number internal/external flows [NASA-TM-84049] N82-11046

NAVIGATION
Flight trajectory control investigation [AD-A104542] N82-11048
An overview of optimal control in aerospace systems N82-11074

NAVIGATION AIDS
Three navigation systems and their costs of acquiring remote sensing data A82-10049

NAVSTAR SATELLITES
FAA acceptance tests on the NAVSTAR GPS Z-Set receiver A82-12639

NETS
The net-skirt to a parachute canopy as a device to prevent inversion [AIAA PAPER 81-1927] A82-10412

NETWORK CONTROL
A solution to the static geometry problem for JTIDS relative navigation A82-12634

NICKEL CADMIUM BATTERIES
Unsolved problems of nickel cadmium batteries A82-11725

NOISE GENERATORS
Rotor wake characteristics relevant to rotor-stator interaction noise generation [AIAA PAPER 81-2031] A82-10456
A comprehensive bibliography of literature on helicopter noise technology [AD-A103331] N82-10812

NOISE MEASUREMENT
Model helicopter rotor impulsive noise A82-11300
SEL and EPNL noise duration coefficients for the 747 and T-38 aircraft [NASA-TM-83214] N82-11860

NOISE POLLUTION
A comprehensive bibliography of literature on helicopter noise technology [AD-A103331] N82-10812
Effects of aircraft noise on the equilibrium of airport residents: Testing and utilization of a new methodology [NASA-TM-76628] N82-11636

NOISE PREDICTION (AIRCRAFT)
Helicopter rotor trailing edge noise [AIAA PAPER 81-2001] A82-10455
Rotor wake characteristics relevant to rotor-stator interaction noise generation [AIAA PAPER 81-2031] A82-10456
Effects of vane/blade ratio and spacing on fan noise [AIAA PAPER 81-2033] A82-10457
Helicopter rotor trailing edge noise --- noise prediction [NASA-CR-3470] N82-11859

NOISE REDUCTION
'Quiet please' --- aircraft hydraulic systems noise reduction A82-10854
Design predictions for noise control in the cryogenic National Transonic Facility A82-12025
Experimental modal analysis of the fuselage panels of an Aero Commander aircraft [NASA-CR-165750] N82-10028
Comparative study of flare control laws [NASA-CR-164903] N82-10032
A comprehensive bibliography of literature on helicopter noise technology [AD-A103331] N82-10812

NOISE SPECTRA
SEL and EPNL noise duration coefficients for the 747 and T-38 aircraft [NASA-TM-83214] N82-11860

NONLINEAR SYSTEMS
Fatigue substantiation of non-linear structures A82-11224
A geometric approach to multivariable control system synthesis N82-10056
Theory of stochastic optimal control some basic notions N82-11075
Application of nonlinear systems inverses to automatic flight control design: System concepts and flight evaluations N82-11083

NOZZLE DESIGN
Developments in boundary layer Thrust Vector Control A82-10855

NUMERICAL ANALYSIS
The use of the Weber method for minicomputer-assisted numerical analysis of airfoils A82-10362
Numerical treatment of helicopter rotor stability problems A82-12045
Procedures and analysis techniques for determining static air minimum control speeds A82-12564
The need for multivariable design and analysis techniques N82-10049

NUMERICAL FLOW VISUALIZATION
A numerical three-dimensional turbulent simulation of a subsonic VSTOL jet in a cross-flow using a finite element algorithm [AD-A104514] N82-11055

NYQUIST DIAGRAM
Characteristic and principal gains and phases and their use as multivariable control design tools --- generalizing Nyquist and root-locus diagram techniques N82-10050

O

OH-58 HELICOPTER
Composite main rotor tubular braided A82-10547

OMEGA NAVIGATION SYSTEM
Omega station 10.2 kHz signal selection made easy A82-12636

ONBOARD DATA PROCESSING
Description of the meteorological research radar system aboard NOAA/Research Facilities Center WP-3D aircraft
A82-10217
Navigation task partitioning in distributed-processing avionics systems
A82-10646
OPENINGS
Structural analysis of fuselages with cutouts by finite element method
N82-10995
OPTICAL MEASURING INSTRUMENTS
Optical sensors for displacement measurement
A82-11407
OPTIMAL CONTROL
Design of high integrity multivariable control systems
N82-10055
Multivariables design: The optimization of approximate inverses
N82-10057
Flight trajectory control investigation
[AD-A104542] N82-11048
Theory and applications of optimal control in aerospace systems
[AGARD-AG-251] N82-11073
An overview of optimal control in aerospace systems
N82-11074
Theory of stochastic optimal control some basic notions
N82-11075
An introduction to stochasic optimal control theory
N82-11076
Design considerations for optimal flight control systems
N82-11077
Design techniques for mutlivariable flight control systems
N82-11078
Control law design for transport aircraft flight tasks
N82-11080
Control design of flexible spacecraft
N82-11081
Optimum climb and descent trajectories for airline missions
N82-11082
Management of redundancy in flight control systems using optimal decision theory
N82-11084
OPTIMIZATION
Optimization of the principal design parameters of a passenger aircraft
A82-10816
ORGANIC LIQUIDS
Rheological behavior of progressively shear-thickening solutions --- aircraft fuel polymer additives for fire protection in survivable crashes
A82-11177
ORTHOGONALITY
The arbitrary quasi-orthogonal surface method for computing three-dimensional flow in turbine machinery. 2. Calculation of the three-dimensional flow with the S sub 1-surface twisted
N82-11015

P

PAINTS
Automated Paint and Process Line /APPL/ --- for aircraft production
[AIAA 81-2166] A82-10120
PANELS
Response of nonlinear aircraft structural panels to high intensity noise
A82-12041
PARACHUTE DESCENT
Aerodynamics and performance of cruciform parachute canopies
[AIAA PAPER 81-1919] A82-10405
Experimental determination of parachute apparent mass and its significance in predicting dynamic stability
[AIAA PAPER 81-1920] A82-10406
Comparison of simulation and experimental data for a gliding parachute in dynamic flight
[AIAA PAPER 81-1924] A82-10409
Theoretical analysis of parachute inflation including fluid kinetics
[AIAA PAPER 81-1925] A82-10410
The constricted rigging line trials technique for assessing the opening characteristics of parachutes
[AIAA PAPER 81-1932] A82-10413
Reductions in parachute drag due to forebody wake effects
[AIAA PAPER 81-1939] A82-10417
Aeroballistic characteristics of sonobuoy parachute decelerators limited to a length of three feet
[AIAA PAPER 81-1950] A82-10425
Inflatable system for fast deployment of parachutes at low altitudes from slow moving aircraft or stationary supports
[AIAA PAPER 81-1953] A82-10428
A contribution to the stabilization of flight vehicle parachute systems --- mathematical models
[ESA-TT-679] N82-10046
PARACHUTE FABRICS
Stress measurements in bias constructed parachute canopies during inflation and at steady-state
[AIAA PAPER 81-1945] A82-10421
Development of a nylon-Kevlar recovery system for the CL-289 /AN/USD 502/ surveillance drone
[AIAA PAPER 81-1952] A82-10427
PARACHUTES
Experimental determination of parachute apparent mass and its significance in predicting dynamic stability
[AIAA PAPER 81-1920] A82-10406
Development of new lifting parachute designs with increased trim angle
[AIAA PAPER 81-1921] A82-10407
The net-skirt to a parachute canopy as a device to prevent inversion
[AIAA PAPER 81-1927] A82-10412
A modular asymmetric parachute for wind tunnel testing
[AIAA PAPER 81-1933] A82-10414
Parachute technology under pressure
A82-12804
PARAMETER IDENTIFICATION
Parametric study of microwave-powered high-altitude airplane platforms designed for linear flight
[NASA-TP-1918] N82-11050
PARAMETERIZATION
Estimation of airplane stability and control derivatives from large amplitude longitudinal maneuvers
[NASA-TM-83185] N82-10042
PARTICLE SIZE DISTRIBUTION
Determination of vertical profiles of aerosol size spectra from aircraft radiative flux measurements. II - The effect of particle nonsphericity
A82-12149
PASSENGER AIRCRAFT
How large should a commuter transport be
[AIAA PAPER 81-1732] A82-10463
Optimization of the principal design parameters of a passenger aircraft
A82-10816
Lightweight diesel engine designs for commuter type aircraft
[NASA-CR-165470] N82-11068
PAVEMENTS
Design of airport pavements for expansive soils
[AD-A104660] N82-11313
Structural analysis computer programs for rigid multicomponent pavement structures with discontinuities, WESLIQID and WESLAYER. Report 1: Program development and numerical presentations
[AD-A104545] N82-11498
PAYLOADS
Limiting payload deceleration during ground impact
[AIAA PAPER 81-1918] A82-10404
PERFORMANCE PREDICTION
Ideal and simulated performance of an aircraft in the terrain following mission
A82-11302

On the prediction of swirling flowfields found in axisymmetric combustor geometries A82-12120
Parametric study of microwave-powered high-altitude airplane platforms designed for linear flight [NASA-TP-1918] N82-11050

PERFORMANCE TESTS
Interoperability testing of decentralized command, control, communications and intelligence /C3I/ systems [AIAA 81-2205] A82-10143
Air bag impact attenuation system for the AQM-34V remote piloted vehicle [AIAA PAPER 81-1917] A82-10403
Aerodynamics and performance of cruciform parachute canopies [AIAA PAPER 81-1919] A82-10405
The constricted rigging line trials technique for assessing the opening characteristics of parachutes [AIAA PAPER 81-1932] A82-10413
High-efficiency hydraulic power transfer units for multisystem aircraft A82-10853
The certification of digital systems A82-11940
FAA acceptance tests on the NAVSTAR GPS Z-Set receiver A82-12639

PERTURBATION THEORY
Synthesis of system for evaluating gyrostabilizer state with unknown disturbances A82-11469

PHOTOELASTICITY
New molding method of three-dimensional hollow photoelastic model and centrifugal stress analysis of air cooled turbine blade model [NAL-TR-427T] N82-11067

PILOT TRAINING
Spin recovery training --- licensing requirement [GPO-66-020] N82-10022

PILOTS (PERSONNEL)
Development and construction of pilot ejector seats in Germany from 1938-1945 [DFVLR-FB-81-04] N82-10026

PISTON ENGINES
The CIVIC - A concept in vortex induced combustion. II [ASME PAPER 81-GT-12] A82-11997

PLANETARY BOUNDARY LAYER
Multiple Doppler radar observations of PBL structure A82-10292

PLANING
A navigation systems planning model A82-12640

PLASMA SPRAYING
Thermal-barrier-coated turbine blade study [NASA-CR-165351] N82-10040

PLASTIC AIRCRAFT STRUCTURES
On the use of carbon composites in slat and stabilizer construction A82-11468
Seven years experience with Kevlar-49 in the Lockheed L-1011 Tristar A82-12647

PLOTTING
Multivariable design techniques based on singular value generalizations of classical control N82-10051

PNEUMATIC EQUIPMENT
A new APU for medium place aircraft environmental control systems [ASME PAPER 81-ENAS-1] A82-10889
Towards minimum power for environmental control in transport aircraft [ASME PAPER 81-ENAS-4] A82-10892
Air supply system bite for Boeing 767 airplane --- Built-In-Test-Equipment [ASME PAPER 81-ENAS-7] A82-10895

POLLUTION CONTROL
Baseline data on utilization of low-grade fuels in gas turbine applications. Volume 3: Emissions evaluation [DE81-903764] N82-10254

POLYETHER RESINS
Polyurethane foams for aircraft shock mounts. 3: Vibration damping by polyether foams [AD-A104496] N82-11212

POLYURETHANE FOAM
Polyurethane foams for aircraft shock mounts. 3: Vibration damping by polyether foams [AD-A104496] N82-11212

POROUS MATERIALS
Development of low modulus material for use in ceramic gas path seal applications [NASA-CR-165469] N82-10039
Icing tunnel tests of a composite porous leading edge for use with a liquid anti-ice system --- Lewis icing research tunnel [NASA-CR-164966] N82-11052

POROUS WALLS
Thermal and flow analysis of a convection, air-cooled ceramic coated porous metal concept for turbine vanes [ASME PAPER 81-HT-48] A82-10952
End losses in turbine cascades with porous cooling A82-11430
Results of experimental study of heat transfer to turbine blades with porous cooling A82-11486

POSITION (LOCATION)
A solution to the static geometry problem for JTIDS relative navigation A82-12638
The statistical theory of radio direction finding [AD-A104156] N82-10027

POTENTIAL FLOW
Finite difference computation of the steady transonic potential flow around airplanes N82-10961
Second order approximation theory of an arbitrary aerofoil in compressible potential flow N82-10982
Aerodynamic calculations and design of subcritical aerofoils N82-10983

POWDER METALLURGY
Powder metallurgy superalloys - Aerospace materials for the 1980's; Proceedings of the Conference, Zurich, Switzerland, November 18-20, 1980. Volume 1 A82-12495
Superclean superalloy powders by the rotating electrode process A82-12496
Superalloy turbine components - Which is the superior manufacturing process, as-HIP, HIP plus Isoforge, or 'gatorizing' of extrusion consolidated billet A82-12497
Superalloy powder engine components; controls employed to assure high quality hardware A82-12499

POWER EFFICIENCY
Helicopter engine technology - With particular reference to the Rolls-Royce Gem engine A82-10304
60 KVA ADP permanent magnet VSCF starter generator system - Generator system performance characteristics A82-11721

PRECIPITATION (METEOROLOGY)
The evolution of airborne weather avoidance radar toward a calibrated remote rain gauge using REACT --- Rain Echo Attenuation Compensation Hardware A82-10225

PREDICTION ANALYSIS TECHNIQUES
A new thermal and trajectory model for high altitude balloons [AIAA PAPER 81-1926] A82-10411

PRESSURE DISTRIBUTION
The use of the Weber method for minicomputer-assisted numerical analysis of airfoils A82-10362
Aerodynamic calculations and design of subcritical aerofoils N82-10983
Initial experimental research into the response of turbojet engine compressors to distortion of intake pressure N82-11006
A preliminary experimental investigation of the response of a turbojet engine to inlet pressure distortion N82-11907

A comparison of theoretical and experimental pressure distributions for two advanced fighter wings
[NASA-TM-81331] N82-11054

PRESSURE OSCILLATIONS
One reason for the onset of high-frequency self-excited oscillations --- in combustion chambers of aircraft engines
A82-11448

PRESSURE REDUCTION
Thermal and flow analysis of a convection, air-cooled ceramic coated porous metal concept for turbine vanes
[ASME PAPER 81-HT-40] A82-10952

PRESSURIZED CABINS
Air supply system bite for Boeing 767 airplane --- Built-In-Test-Equipment
[ASME PAPER 81-ENAS-7] A82-10895

PROBABILITY THEORY
Extending the limits of reliability theory --- Book
A82-12318

PROCEDURES
Proposed standard requirements and procedures for icing clearance
N82-11061

PRODUCT DEVELOPMENT
Study and development of an integrated head-up display
[AD-A104337] N82-11062
Integrated analysis of engine
[NASA-TM-82713] N82-11491

PRODUCTION ENGINEERING
Automated Paint and Process Line /APPL/ --- for aircraft production
[AIAA 81-2166] A82-10120
Development of aircraft production engineering discipline at IIT, Bombay
A82-11317
A CFRP taileron for the Tornado: Construction and production --- horizontal stabilizer
[MBB-FE-212/KPK/PUB/2] N82-10035

PROGRAM VERIFICATION (COMPUTERS)
The Space Shuttle vehicle checkout involving flight avionics software
[AIAA 81-2141] A82-10100

PROJECT MANAGEMENT
Implementation of AVRADCOM MM&T --- for military aircraft parts production engineering
A82-10545

PROPELLER FANS
Propfan installation aerodynamics of a supercritical swept wing transport configuration
[AIAA PAPER 81-1563] A82-10466

PROPULSIVE EFFICIENCY
Quiet short-haul research aircraft familiarization document, revision 1
[NASA-TM-81298] N82-10031
Propulsion study for Small Transport Aircraft Technology (STAT), Appendix B
[NASA-CR-165499-APP-B] N82-10038

PROTECTIVE COATINGS
Thermal-barrier-coated turbine blade study
[NASA-CR-165351] N82-10040

PROTUBERANCES
Aircraft excrescence drag
[AGARD-AG-264] N82-10020

PUMPS
High-efficiency hydraulic power transfer units for multisystem aircraft
A82-10853

Q

QUADRATIC EQUATIONS
LQG-based multivariable design: Frequency domain interpretation
N82-10053
LQG multivariable design tools
N82-10054

QUIET ENGINE PROGRAM
Quiet short-haul research aircraft familiarization document, revision 1
[NASA-TM-81298] N82-10031

R

RADAR ATTENUATION
The evolution of airborne weather avoidance radar toward a calibrated remote rain gauge using REACT --- Rain Echo Attenuation Compensation Hardware
A82-10225

RADAR DATA
Description of the meteorological research radar system aboard NOAA/Research Facilities Center WP-3D aircraft
A82-10217

RADAR DETECTION
Instrumented aircraft verification of clear-air radar detection of low-level wind shear
A82-10221

RADAR MAPS
Radar mapping, archaeology, and ancient land use in the Maya lowlands
[NASA-CR-164931] N82-11514

RADAR MEASUREMENT
Multiple Doppler radar observations of PBL structure
A82-10292

RADAR TARGETS
Synthetic aperture radar target simulator
[NASA-CASE-NPO-15024-1] N82-10286

RADAR TRACKING
Hard limited approaches to correlation velocity sensing
A82-12636

RADIANT FLUX DENSITY
Determination of vertical profiles of aerosol size spectra from aircraft radiative flux measurements. II - The effect of particle nonsphericity
A82-12149

RADIO DIRECTION FINDERS
The statistical theory of radio direction finding
[AD-A104156] N82-10027

RADIO NAVIGATION
Omega station 10.2 kHz signal selection made easy
A82-12638
FAA acceptance tests on the NAVSTAR GPS Z-Set receiver
A82-12639

RADIO RECEIVERS
Tangential sensitivity of EW receivers
A82-11020
FAA acceptance tests on the NAVSTAR GPS Z-Set receiver
A82-12639

RADIO RELAY SYSTEMS
A mathematical model of an over-sea airborne UHF radio link
A82-11406

RADIO TRACKING
The statistical theory of radio direction finding
[AD-A104156] N82-10027

RAIN
Airborne weather radar and severe weather penetration
A82-10219

RAIN GAGES
The evolution of airborne weather avoidance radar toward a calibrated remote rain gauge using REACT --- Rain Echo Attenuation Compensation Hardware
A82-10225

RAMJET ENGINES
Air-film cooling returns to ramjets
[ASME PAPER 81-ENAS-8] A82-10896
An investigation of the combustion process in solid fuel ramjets
[AD-A104603] N82-11232

REAL TIME OPERATION
Real-time, on-line digital simulation of optimum maneuvers of supersonic aircraft
[AIAA 81-2178] A82-10127

RECIRCULATIVE FLUID FLOW
On the prediction of swirling flowfields found in axisymmetric combustor geometries
A82-12120

RECOVERY PARACHUTES
Development of a nylon-Kevlar recovery system for the CL-289 /AN/USD 502/ surveillance drone
[AIAA PAPER 81-1952] A82-10427

RECTANGULAR PLATES
Response of nonlinear aircraft structural panels to high intensity noise
A82-12041
RECTANGULAR WINGS
On evaluating the influence of local disruptions of flow over trailing edge and leading edge flaps from the data of wind tunnel tests of a rectangular wing segment
A82-11465
Experimental investigations of the separated flow around a rectangular wing --- in a wind tunnel
[DFVLR-FB-81-12] N82-10017
REDUNDANCY
Management of redundancy in flight control systems using optimal decision theory
N82-11084
REGISTERS
Air-breathing engine test facilities register
[AGARD-AG-269] N82-10063
REGRESSION ANALYSIS
Determination of airplane model structure from flight data by using modified stepwise regression
[NASA-TP-1916] N82-10041
Estimation of airplane stability and control derivatives from large amplitude longitudinal maneuvers
[NASA-TM-83185] N82-10042
RELIABILITY ANALYSIS
Extending the limits of reliability theory --- Book
A82-12316
REMOTE SENSING
Three navigation systems and their costs of acquiring remote sensing data
A82-10049
REMOTELY PILOTED VEHICLES
HiMAT onboard flight computer system architecture and qualification
[AIAA 81-2107] A82-10082
Air bag impact attenuation system for the AQM-34V remote piloted vehicle
[AIAA PAPER 81-1917] A82-10403
Design and development of a low cost servoed rate gyro for unmanned aircraft
A82-11932
Parametric study of microwave-powered high-altitude airplane platforms designed for linear flight
[NASA-TP-1918] N82-11050
RENE 95
Superalloy powder engine components; controls employed to assure high quality hardware
A82-12499
RESCUE OPERATIONS
SARSAT applications
A82-12698
RESEARCH AND DEVELOPMENT
Development and construction of pilot ejector seats in Germany from 1938-1945
[DFVLR-FB-81-04] N82-10026
RESEARCH FACILITIES
Description of the meteorological research radar system aboard NOAA/Research Facilities Center WP-3D aircraft
A82-10237
RESIDENTIAL AREAS
Effects of aircraft noise on the equilibrium of airport residents: Testing and utilization of a new methodology
[NASA-TM-76628] N82-11636
RESOLUTION
Study and development of an integrated head-up display
[AD-A104337] N82-11062
RESONANT FREQUENCIES
Calculation of natural modes of vibration for rotor blades by the finite element method
[DFVLR-FB-81-07] N82-10452
RETRACTABLE EQUIPMENT
Analytical determination of undercarriage retraction kinematics
A82-10363
REYNOLDS NUMBER
Computation of high Reynolds number internal/external flows
[NASA-TM-84049] N82-11046
RHEOLOGY
Rheological behavior of progressively shear-thickening solutions --- aircraft fuel polymer additives for fire protection in survivable crashes
A82-11177
RIBBON PARACHUTES
The effects of flexibility on the steady-state performance of small ribbon parachute models
[AIAA PAPER 81-1923] A82-10408
Stress measurements in a ribbon parachute canopy during inflation and at steady state
[AIAA PAPER 81-1944] A82-10420
RIGID ROTORS
Development of the Triflex rotor head
A82-11222
RING LASERS
Ring Laser Gyro Navigator /RLGN/ flight test results
A82-12644
ROBUSTNESS (MATHEMATICS)
Limitations on achievable performance of multivariable feedback systems
N82-10052
ROCKET ENGINES
The enhancement of heat exchange in channels /2nd revised and enlarged edition/ --- Russian book
A82-12222
ROCKET NOZZLES
Developments in boundary layer Thrust Vector Control
A82-10855
ROCKET-BORNE INSTRUMENTS
Limiting payload deceleration during ground impact
[AIAA PAPER 81-1910] A82-10404
ROTARY GYROSCOPES
Fast and accurate gyrocompass using strapdown tuned rotor gyros as a solution to combat helicopters navigation problems
A82-11927
Design considerations for the direct digital control of dry-tuned gyroscope
A82-11933
ROTARY WING AIRCRAFT
On computing Floquet transition matrices of rotorcraft.
A82-11225
ROTARY WINGS
Helicopter rotor trailing edge noise
[AIAA PAPER 81-2001] A82-10455
Composite main rotor tubular braided
A82-10547
Model helicopter rotor impulsive noise
A82-11300
Numerical treatment of helicopter rotor stability problems
A82-12045
Standard tests of a research model rotor in a wind tunnel, including model similarity --- calculations compared with measurements
[BMVG-FBWT-79-16] N82-10016
Rotorcraft icing: Status and prospects
[AGARD-AR-166] N82-11056
Operational environment, meteorological conditions and weather forecasting
N82-11057
Technology base for icing instrumentation and mathematical modelling
N82-11058
Facilities for development and clearance
N82-11059
Ice protection system technology
N82-11060
Proposed standard requirements and procedures for icing clearance
N82-11061
Aeroacoustic theory for noncompact wing-gust interaction
[FDRL-81-7] N82-11071
Helicopter rotor trailing edge noise --- noise prediction
[NASA-CR-3470] N82-11859
ROTATING BODIES
The Shock and Vibration Digest, volume 13, no. 9
[AD-A105062] N82-10421
ROTATING FLUIDS
A theoretical analysis of the stream surface of revolution with supersonic inlet flow in a transonic axial compressor
N82-11025

ROTOR AERODYNAMICS
Rotor wake characteristics relevant to rotor-stator interaction noise generation [AIAA PAPER 81-2031] A82-10456
Wind tunnel tests on airfoils in tandem cascade A82-10987
Numerical treatment of helicopter rotor stability problems A82-12045
ROTOR BLADES (TURBOMACHINERY)
Effects of vane/blade ratio and spacing on fan noise [AIAA PAPER 81-2033] A82-10457
ROTOR SPEED
60 KVA ADP permanent magnet VSCF starter generator system - Generator system performance characteristics A82-11721
RUBBER
The possibility of using deformable rubber components in landing gear A82-10496
RUNWAYS
Design of airport pavements for expansive soils [AD-A104660] N82-11313

S

SAFETY MANAGEMENT
A proposed flight safety program for the Korean Air Force [AD-A102373] N82-10023
System safety program plan --- electromagnetic pulse testing of the A-7E aircraft [AD-A104557] N82-11354
SANDWICH STRUCTURES
Impact-initiated damage thresholds in composites A82-12028
SARSAT
SARSAT applications A82-12698
SATELLITE NAVIGATION SYSTEMS
National Aerospace Meeting, Trevose, PA, April 8-10, 1981, Proceedings A82-12626
Satellite geometry considerations for low cost GPS user equipment A82-12630
A navigation systems planning model A82-12640
Integrated satellite navigation and strapdown attitude and heading reference systems for civil air carriers A82-12643
SATELLITE NETWORKS
Satellite geometry considerations for low cost GPS user equipment A82-12630
SCALE MODELS
Standard tests of a research model rotor in a wind tunnel, including model similarity --- calculations compared with measurements [BMVG-FBWT-79-16] N82-10016
SEALS (STOPPERS)
Development of low modulus material for use in ceramic gas path seal applications [NASA-CR-165469] N82-10039
SEARCH RADAR
Threat Alert and Collision Avoidance System (TCAS) Symposium [AD-A104563] N82-11047
SELF OSCILLATION
One reason for the onset of high-frequency self-excited oscillations --- in combustion chambers of aircraft engines A82-11448
SENSITIVITY
Feedback and minimax sensitivity N82-10058
SEPARATED FLOW
Strong matching method for computing transonic viscous flows including wakes and separations - Lifting airfoils A82-10821
Nonlinear prediction of subsonic aerodynamic loads on wings and bodies at high angles of attack A82-11359
Experimental investigations of the separated flow around a rectangular wing --- in a wind tunnel [DFVLR-FB-81-12] N82-10017
SEPARATORS
New separators for battery systems A82-11715
SERVICE LIFE
Design considerations for duty cycle, life and reliability of small limited life engines [AIAA PAPER 81-1402] A82-10465
Unsolved problems of nickel cadmium batteries A82-11725
SERVOCONTROL
A method for determination of the aeroelastic behavior of aircraft with active control systems [DFVLR-FB-81-05] N82-10047
SHALE OIL
Jet fuel looks to shale oil: The 1980 technology review [AD-A104414] N82-11228
SHEAR STRESS
Crack growth evaluation of a method to convert real-time loads history to a simplified engineering spectra --- for aircraft structural analysis A82-12043
SHIP TERMINALS
A mathematical model of an over-sea airborne UHF radio link A82-11406
SHOCK ABSORBERS
Polyurethane foams for aircraft shock mounts. 3: Vibration damping by polyether foams [AD-A104496] N82-11212
SHOCK LOADS
Dynamic response of aircraft structure to gun shock loads A82-11314
The Shock and Vibration Digest, volume 13, no. 9 [AD-A105062] N82-10421
SHOCK WAVE PROPAGATION
Acta mechanica sinica [AD-A105184] N82-11014
SHORT HAUL AIRCRAFT
Quiet short-haul research aircraft familiarization document, revision 1 [NASA-TM-81298] N82-10031
Propulsion study for Small Transport Aircraft Technology (STAT) [NASA-CR-165499] N82-10037
SHORT TAKEOFF AIRCRAFT
Quiet short-haul research aircraft familiarization document, revision 1 [NASA-TM-81298] N82-10031
Development and evaluation of automatic landing control laws for light wing loading STOL aircraft [NASA-CR-166160] N82-10043
SIGNAL PROCESSING
Omega station 10.2 kHz signal selection made easy A82-12638
SIGNAL TO NOISE RATIOS
Tangential sensitivity of EW receivers A82-11020
SIMILARITY THEOREM
Standard tests of a research model rotor in a wind tunnel, including model similarity --- calculations compared with measurements [BMVG-FBWT-79-16] N82-10016
SIZE DISTRIBUTION
The dispersion of drop sizes in gas turbine fuel nozzle sprays A82-12107
SKIRTS
The net-skirt to a parachute canopy as a device to prevent inversion [AIAA PAPER 81-1927] A82-10412
SLABS
Structural analysis computer programs for rigid multicomponent pavement structures with discontinuities, WESLIQID and WESLAYER. Report 1: Program development and numerical presentations [AD-A104545] N82-11498
SNAP
Experimental study of empennage snap-through vibrations A82-11471
SOIL MECHANICS
Design of airport pavements for expansive soils [AD-A104660] N82-11313
SOILS
Design of airport pavements for expansive soils [AD-A104660] N82-11313

SOLAR POWERED AIRCRAFT
  Wings in the sun - The evolution of Solar Challenger
  A82-12694
SOLID ELECTRODES
  Unsolved problems of nickel cadmium batteries
  A82-11725
SOLID PROPELLANT COMBUSTION
  An investigation of the combustion process in solid fuel ramjets
  [AD-A104603] N82-11232
SOLID PROPELLANTS
  An investigation of the combustion process in solid fuel ramjets
  [AD-A104603] N82-11232
SONOBUOYS
  Aeroballistic characteristics of sonobuoy parachute decelerators limited to a length of three feet
  [AIAA PAPER 81-1950] A82-10425
SOUND PRESSURE
  Evaluation of the acoustic measurement capability of the NASA Langley V/STOL wind tunnel open test section with acoustically absorbent ceiling and floor treatments
  [NASA-CR-165796] N82-10059
SOUND TRANSMISSION
  Experimental modal analysis of the fuselage panels of an Aero Commander aircraft
  [NASA-CR-165750] N82-10028
SPACE NAVIGATION
  National Aerospace Meeting, Trevose, PA, April 8-10, 1981, Proceedings
  A82-12626
  Memory requirements for future navigation systems
  A82-12637
SPACE SHUTTLES
  The Space Shuttle vehicle checkout involving flight avionics software
  [AIAA 81-2141] A82-10100
  Use of Space Shuttle technology in conventional aircraft
  [AIAA 81-2176] A82-10125
SPACE VEHICLE CHECKOUT PROGRAM
  The Space Shuttle vehicle checkout involving flight avionics software
  [AIAA 81-2141] A82-10100
SPACECRAFT CONSTRUCTION MATERIALS
  Powder metallurgy superalloys - Aerospace materials for the 1980's; Proceedings of the Conference, Zurich, Switzerland, November 18-20, 1980. Volume 1
  A82-12495
SPACECRAFT CONTROL
  Synthesis of system for evaluating gyrostabilizer state with unknown disturbances
  A82-11469
SPACECRAFT DESIGN
  Control design of flexible spacecraft
  N82-11081
SPACECRAFT ELECTRONIC EQUIPMENT
  Bridging the gap from aircraft to space computers
  [AIAA 81-2142] A82-10101
SPANWISE BLOWING
  A study on numerical method for evaluating spanwise integral in subsonic lifting-surface theory
  [NAL-TR-661T] N82-11035
SPEED CONTROL
  Procedures and analysis techniques for determining static air minimum control speeds
  A82-12564
SPIN DYNAMICS
  A microprocessor-based data acquisition system for stall/spin research
  [AIAA 81-2177] A82-10126
SPOILERS
  Theoretical investigation of the influence of spoiler dynamics on the handling qualities of an aircraft with direct lift control
  [ESA-TT-681] N82-10036
  Development and evaluation of automatic landing control laws for light wing loading STOL aircraft
  [NASA-CR-166160] N82-10043
  System identification of the longitudinal motion of the DFVLR HFB 320 research aircraft with particular consideration of control surface effectiveness
  [ESA-TT-666] N82-10045
SPRAY NOZZLES
  The dispersion of drop sizes in gas turbine fuel nozzle sprays
  A82-12107
  Helicopter icing spray system - Improvements and flight experience
  A82-12696
STABILIZERS (AGENTS)
  On the use of carbon composites in slat and stabilizer construction
  A82-11460
STANDARDS
  Rotorcraft icing: Status and prospects
  [AGARD-AR-166] N82-11056
  Proposed standard requirements and procedures for icing clearance
  N82-11067
STATE VECTORS
  Synthesis of system for evaluating gyrostabilizer state with unknown disturbances
  A82-11469
STEADY FLOW
  Finite difference computation of the steady transonic potential flow around airplanes
  N82-10981
STEADY STATE
  The effects of flexibility on the steady-state performance of small ribbon parachute models
  [AIAA PAPER 81-1923] A82-10408
STIFFNESS MATRIX
  Formation of triangular-element stiffness matrix using sliding interpolation
  A82-11464
  An influence coefficient method for the application of the modal technique to wing flutter suppression of the DAST ARW-1 wing
  [NASA-CR-165772] N82-11070
STOCHASTIC PROCESSES
  Synthesis of system for evaluating gyrostabilizer state with unknown disturbances
  A82-11469
  Theory of stochastic optimal control some basic notions
  N82-11075
  An introduction to stochasic optimal control theory
  N82-11076
STORAGE BATTERIES
  New separators for battery systems
  A82-11715
STORMS (METEOROLOGY)
  Applications of conventional and Doppler radars for aviation safety
  A82-10215
STRAPDOWN INERTIAL GUIDANCE
  Fast and accurate gyrocompass using strapdown tuned rotor gyros as a solution to combat helicopters navigation problems
  A82-11927
  Design considerations for the direct digital control of dry-tuned gyroscope
  A82-11933
  Simulation study of a hybrid strapdown attitude and heading reference system
  A82-12641
  The integrated inertial sensor assembly /IISA/ - A redundant strapdown system for advanced aircraft navigation and flight control functions
  A82-12642
  Integrated satellite navigation and strapdown attitude and heading reference systems for civil air carriers
  A82-12643
STREAM FUNCTIONS (FLUIDS)
  An aerodynamic design method for transonic axial flow compressor stage
  N82-10980
STRESS ANALYSIS
  Lineup of the IM-series aircraft-derivative gas turbines
  A82-12560
  New molding method of three-dimensional hollow photoelastic model and centrifugal stress analysis of air cooled turbine blade model
  [NAL-TR-427T] N82-11067
STRESS CORROSION CRACKING
  The application of improved aluminium alloys and steels in aircraft structures
  A82-10305

STRESS MEASUREMENT
Stress measurements in a ribbon parachute canopy during inflation and at steady state
[AIAA PAPER 81-1944] A82-10420
Stress measurements in bias constructed parachute canopies during inflation and at steady-state
[AIAA PAPER 81-1945] A82-10421
STRUCTURAL ANALYSIS
Formation of triangular-element stiffness matrix using sliding interpolation
A82-11464
Crack growth evaluation of a method to convert real-time loads history to a simplified engineering spectra --- for aircraft structural analysis
A82-12043
Mathematical model for the maintenance program of modern jet aircraft --- crack detection; inspection intervals
[DFVLR-FB-81-14] N82-10002
Structural analysis of fuselages with cutouts by finite element method
N82-10995
Matrix analysis of wings
N82-10998
Integrated analysis of engine
[NASA-TM-82713] N82-11491
Structural analysis computer programs for rigid multicomponent pavement structures with discontinuities, WESLIQID and WESLAYER. Report 1: Program development and numerical presentations
[AD-A104545] N82-11498
STRUCTURAL DESIGN
Light aircraft structural design in non-metallics - Use of composite honeycomb for light aircraft
A82-10308
Emerging technologies in aerospace structures, design, structural dynamics and materials; Proceedings of the Aerospace Conference, San Francisco, CA, August 13-15, 1980
A82-12026
Determination of airplane model structure from flight data by using modified stepwise regression
[NASA-TP-1916] N82-10041
Control design of flexible spacecraft
N82-11081
Design of airport pavements for expansive soils
[AD-A104660] N82-11313
STRUCTURAL FAILURE
A note on fatal aircraft accidents involving metal fatigue
A82-11400
STRUCTURAL INFLUENCE COEFFICIENTS
An influence coefficient method for the application of the modal technique to wing flutter suppression of the DAST ARW-1 wing
[NASA-CR-165772] N82-11070
STRUCTURAL RELIABILITY
Lineup of the IM-series aircraft-derivative gas turbines
A82-12560
STRUCTURAL STABILITY
An influence coefficient method for the application of the modal technique to wing flutter suppression of the DAST ARW-1 wing
[NASA-CR-165772] N82-11070
STRUCTURAL STRAIN
Optical sensors for displacement measurement
A82-11407
STRUCTURAL VIBRATION
Helicopter engine technology - With particular reference to the Rolls-Royce Gem engine
A82-10304
Lineup of the IM-series aircraft-derivative gas turbines
A82-12560
New estimation method for flutter or divergence boundary from random responses at subcritical speeds
[NAL-TR-667T] N82-11034
SUBSONIC AIRCRAFT
Air-freon integrated environmental conditioning system for trainer subsonic aircraft
[ASME PAPER 81-ENAS-33] A82-10920
SUBSONIC FLOW
The use of the Weber method for minicomputer-assisted numerical analysis of airfoils
A82-10362
Experimental study of subsonic and transonic flows past a wing
A82-10363
Nonlinear prediction of subsonic aerodynamic loads on wings and bodies at high angles of attack
A82-11359
Theoretical investigations and experimental researches for higher subsonic two-dimensional compressor cascade
N82-11024
Aeroacoustic theory for noncompact wing-gust interaction
[FDRL-81-7] N82-11071
On the kernel function collocation method in steady subsonic flow for wing with control surfaces
N82-12023
SUBSONIC WIND TUNNELS
Subsonic cascade wind tunnel tests using a compressor configuration of DCA blades
[AD-A104597] N82-11069
SUCTION
Amplified crossflow disturbances in the laminar boundary layer on swept wings with suction
[NASA-TP-1902] N82-11391
SUPERCRITICAL WINGS
Propfan installation aerodynamics of a supercritical swept wing transport configuration
[AIAA PAPER 81-1563] A82-10466
A comparison of theoretical and experimental pressure distributions for two advanced fighter wings
[NASA-TM-81331] N82-11054
SUPERSONIC AIRCRAFT
Real-time, on-line digital simulation of optimum maneuvers of supersonic aircraft
[AIAA 81-2178] A82-10127
SUPERSONIC COMBUSTION RAMJET ENGINES
Multiple-scale turbulence modeling of free turbulent flows
[ASME PAPER 81-FE-20] A82-10934
SUPERSONIC FLIGHT
Optimal flight paths for winged, supersonic flight vehicles - Extension to the case where thrust can be vectored
A82-10310
SUPERSONIC INLETS
A theoretical analysis of the stream surface of revolution with supersonic inlet flow in a transonic axial compressor
N82-11025
SUPERSONIC JET FLOW
Multiple-scale turbulence modeling of free turbulent flows
[ASME PAPER 81-FE-20] A82-10934
SUPERSONIC SPEEDS
The principles and methods for shaping the wing root regions of a wing-body combination at transonic and lower supersonic speeds
N82-11016
SURFACE LAYERS
Results of experimental study of heat transfer to turbine blades with porous cooling
A82-11446
SURFACE PROPERTIES
Design of airport pavements for expansive soils
[AD-A104660] N82-11313
SURFACE VEHICLES
Characteristics and trends of energy consumption in transport missions with aircraft and surface vehicles
A82-10495
SURFACES
A study on numerical method for evaluating spanwise integral in subsonic lifting-surface theory
[NAL-TR-661T] N82-11035
SURGES
High voltage surge and partial discharge test to evaluate aerospace equipment parts
A82-11740
SURVEILLANCE RADAR
Airborne associative processor /ASPRO/ --- for early warning radar surveillance, command, and control applications
[AIAA 81-2145] A82-10104

SWEAT COOLING
Results of experimental study of heat transfer to turbine blades with porous cooling A82-11446

SWEPT WINGS
Propfan installation aerodynamics of a supercritical swept wing transport configuration [AIAA PAPER 81-1563] A82-10466
Amplified crossflow disturbances in the laminar boundary layer on swept wings with suction [NASA-TP-1902] N82-11391

SWITCHING CIRCUITS
Advanced aircraft electrical system control technology demonstrator. Phase 1: Requirements analysis and conceptual design [AD-A103922] N82-10326

SYNTHETIC APERTURE RADAR
Synthetic aperture radar target simulator [NASA-CASE-NPO-15024-1] N82-10286

SYSTEM FAILURES
Extending the limits of reliability theory --- Book A82-12318

SYSTEMS ANALYSIS
Multi-variable analysis and design techniques [AGARD-LS-117] N82-10048
Multivariable design techniques based on singular value generalizations of classical control N82-10051

SYSTEMS ENGINEERING
Acoustic emission - An emerging technology for assessing fatigue damage in aircraft structure A82-11149
The certification of digital systems A82-11940
Digital avionics: Promise and practice - An airlines experience in the field A82-11942
Multi-variable analysis and design techniques [AGARD-LS-117] N82-10048
The need for multivariable design and analysis techniques N82-10049
Design of high integrity multivariable control systems N82-10055
A geometric approach to multivariable control system synthesis N82-10056
Multivariables design: The optimization of approximate inverses N82-10057
Design considerations for optimal flight control systems N82-11077
Design techniques for mutlivariable flight control systems N82-11078
Application of nonlinear systems inverses to automatic flight control design: System concepts and flight evaluations N82-11083

SYSTEMS INTEGRATION
KC-135 Avionics Modernization Hot Bench [AIAA 81-2105] A82-10081
Discrete address beacon, navigation and landing system A82-10650
The integrated inertial sensor assembly /IISA/ - A redundant strapdown system for advanced aircraft navigation and flight control functions A82-12642
Integrated satellite navigation and strapdown attitude and heading reference systems for civil air carriers A82-12643

SYSTEMS SIMULATION
Interoperability testing of decentralized command, control, communications and intelligence /C3I/ systems [AIAA 81-2205] A82-10143
Simulation study of a hybrid strapdown attitude and heading reference system A82-12641

T

T-38 AIRCRAFT
SEL and EPNL noise duration coefficients for the 747 and T-38 aircraft [NASA-TM-83214] N82-11060

TACAN
Interoperability testing of decentralized command, control, communications and intelligence /C3I/ systems [AIAA 81-2205] A82-10143

TAIL ASSEMBLIES
Experimental study of empennage snap-through vibrations A82-11471

TARGET SIMULATORS
Synthetic aperture radar target simulator [NASA-CASE-NPO-15024-1] N82-10286

TECHNOLOGICAL FORECASTING
Propulsion study for Small Transport Aircraft Technology (STAT) [NASA-CR-165499] N82-10037

TECHNOLOGY ASSESSMENT
Fluid power technology for the '80s --- Book A82-10851
Jet fuel looks to shale oil: The 1980 technology review [AD-A104414] N82-11228

TECHNOLOGY TRANSFER
Bridging the gap from aircraft to space computers [AIAA 81-2142] A82-10101

TECHNOLOGY UTILIZATION
Use of Space Shuttle technology in conventional aircraft [AIAA 81-2176] A82-10125
The balloon and the airship technological heritage [AIAA PAPER 81-1912] A82-10401
SARSAT applications A82-12698

TELEMETRY
Outsider's look at flight instrumentation [DE81-025409] N82-11066

TEMPERATURE MEASUREMENT
In-situ calibration of flight heat transfer instrumentation [ASME PAPER 81-ENAS-13] A82-10901
Adaptation of a turbine test facility to high-temperature research [RAE-LIB-TRANS-2064] N82-11089

TERRAIN FOLLOWING AIRCRAFT
Ideal and simulated performance of an aircraft in the terrain following mission A82-11302

TEST FACILITIES
Air-breathing engine test facilities register [AGARD-AG-269] N82-10063
Rotorcraft icing: Status and prospects [AGARD-AR-166] N82-11056
Facilities for development and clearance N82-11059
Adaptation of a turbine test facility to high-temperature research [RAE-LIB-TRANS-2064] N82-11089
System safety program plan --- electromagnetic pulse testing of the A-7D aircraft [AD-A104557] N82-11354

TEST PILOTS
Test Pilots' Aviation Safety Workshop, U.S. Naval Postgraduate School, Monterey, CA, February 25-28, 1981, Proceedings A82-10560

THERMAL ENVIRONMENTS
Closed loop environmental control systems for fighter aircraft [ASME PAPER 81-ENAS-2] A82-10890
Quantification of the thermal environment for externally carried aircraft stores and ordnance A82-12100

THERMAL EXPANSION
Thermal expansion accommodation in a jet engine frame A82-11999

THERMAL FATIGUE
Thermal expansion accommodation in a jet engine frame A82-11999

THERMAL PROTECTION
The Shock and Vibration Digest, volume 13, no. 9
[AD-A105062] N82-10421
THERMAL RESISTANCE
Design analysis of high temperature transparent windshields for high performance aircraft
[ASME PAPER 81-ENAS-5] A82-10893
Thermal-barrier-coated turbine blade study
[NASA-CR-165351] N82-10040
THERMAL SIMULATION
A new thermal and trajectory model for high altitude balloons
[AIAA PAPER 81-1926] A82-10411
THERMOCOUPLES
In-situ calibration of flight heat transfer instrumentation
[ASME PAPER 81-ENAS-13] A82-10901
THERMODYNAMIC PROPERTIES
Basic problem of aircraft gasturbine engine analytic design. II
A82-11463
THREE DIMENSIONAL FLOW
Acta mechanica sinica
[AD-A105184] N82-11014
The arbitrary quasi-orthogonal surface method for computing three-dimensional flow in turbine machinery. 2. Calculation of the three-dimensional flow with the S sub 1-surface twisted
N82-11015
A theoretical analysis of the stream surface of revolution with supersonic inlet flow in a transonic axial compressor
N82-11025
A numerical three-dimensional turbulent simulation of a subsonic VSTOL jet in a cross-flow using a finite element algorithm
[AD-A104514] N82-11055
Aeroacoustic theory for noncompact wing-gust interaction
[FDRL-81-7] N82-11071
THREE DIMENSIONAL MOTION
On the question of trailing airplane motion
A82-11470
THRUST CONTROL
V/STOL aircraft and fluid dynamics
[NASA-TM-81328] N82-10029
THRUST REVERSAL
Study of reingestion of exhaust gases with different initial temperature in a reversed turbojet engine
A82-11444
THRUST VECTOR CONTROL
Optimal flight paths for winged, supersonic flight vehicles - Extension to the case where thrust can be vectored
A82-10310
Developments in boundary layer Thrust Vector Control
A82-10855
TIME
SEL and EPNL noise duration coefficients for the 747 and T-38 aircraft
[NASA-TM-83214] N82-11860
TIME LAG
Hard limited approaches to correlation velocity sensing
A82-12636
TIME OPTIMAL CONTROL
LQG-based multivariable design: Frequency domain interpretation
N82-10053
TITANIUM ALLOYS
Sophisticated aircraft structure developments - Combat aeroplanes
A82-10309
TOUCHDOWN
Comparative study of flare control laws
[NASA-CR-164903] N82-10032
TRACKING RADAR
Synthetic aperture radar target simulator
[NASA-CASE-NPO-15024-1] N82-10286
TRADEOFFS
Active control elements on the transonic wing of the Airbus A-300 (ACTTA A). Airbus A-300 with reduced longitudinal stability (ACTTA-C) --- advanced control transonic transport aircraft (ACCTA); design considerations
N82-10044
TRAILING EDGES
Helicopter rotor trailing edge noise
[AIAA PAPER 81-2001] A82-10455
Aircraft wing trailing-edge noise
[NASA-CR-164952] N82-11039
Helicopter rotor trailing edge noise --- noise prediction
[NASA-CR-3470] N82-11859
TRAILING-EDGE FLAPS
On evaluating the influence of local disruptions of flow over trailing edge and leading edge flaps from the data of wind tunnel tests of a rectangular wing segment
A82-11465
System identification of the longitudinal motion of the DFVLR HFB 320 research aircraft with particular consideration of control surface effectiveness
[ESA-TT-666] N82-10045
TRAINING AIRCRAFT
Air-freon integrated environmental conditioning system for trainer subsonic aircraft
[ASME PAPER 81-ENAS-33] A82-10920
TRAJECTORY ANALYSIS
A new thermal and trajectory model for high altitude balloons
[AIAA PAPER 81-1926] A82-10411
TRAJECTORY CONTROL
Flight trajectory control investigation
[AD-A104542] N82-11048
Optimum climb and descent trajectories for airline missions
N82-11082
TRAJECTORY OPTIMIZATION
Optimal flight paths for winged, supersonic flight vehicles - Extension to the case where thrust can be vectored
A82-10310
TRANSFER FUNCTIONS
Limitations on achievable performance of multivariable feedback systems
N82-10052
TRANSONIC COMPRESSORS
A theoretical analysis of the stream surface of revolution with supersonic inlet flow in a transonic axial compressor
N82-11025
TRANSONIC FLOW
Experimental study of subsonic and transonic flows past a wing
A82-10363
Strong matching method for computing transonic viscous flows including wakes and separations - Lifting airfoils
A82-10621
Finite difference computation of the steady transonic potential flow around airplanes
N82-10981
A comparison of theoretical and experimental pressure distributions for two advanced fighter wings
[NASA-TM-81331] N82-11054
TRANSONIC SPEED
The principles and methods for shaping the wing root regions of a wing-body combination at transonic and lower supersonic speeds
N82-11016
TRANSONIC WIND TUNNELS
Design predictions for noise control in the cryogenic National Transonic Facility
A82-12025
TRANSPONDERS
Threat Alert and Collision Avoidance System (TCAS) Symposium
[AD-A104563] N82-11047
TRANSPORT AIRCRAFT
Propfan installation aerodynamics of a supercritical swept wing transport configuration
[AIAA PAPER 81-1563] A82-10466
Characteristics and trends of energy consumption in transport missions with aircraft and surface vehicles
A82-10495
Towards minimum power for environmental control in transport aircraft
[ASME PAPER 81-ENAS-4] A82-10892
Fuel for future transport aircraft
[ASME PAPER 81-HT-80] A82-10965

History of flight testing the L-1011 TriStar jet transport. II - Testing highlights since initial certification of the L-1011-1
A82-12049
Theoretical investigation of the influence of spoiler dynamics on the handling qualities of an aircraft with direct lift control
[ESA-TT-681] N82-10036
Propulsion study for Small Transport Aircraft Technology (STAT)
[NASA-CR-165499] N82-10037
Propulsion study for Small Transport Aircraft Technology (STAT), Appendix B
[NASA-CR-165499-APP-B] N82-10038
Control law design for transport aircraft flight tasks
N82-11080

TRAPEZOIDAL WINGS
Experimental study of subsonic and transonic flows past a wing
A82-10363

TUBE HEAT EXCHANGERS
The enhancement of heat exchange in channels /2nd revised and enlarged edition/ --- Russian book
A82-12222

TURBINE BLADES
Thermal and flow analysis of a convection, air-cooled ceramic coated porous metal concept for turbine vanes
[ASME PAPER 81-HT-48] A82-10952
End losses in turbine cascades with porous cooling
A82-11434
Results of experimental study of heat transfer to turbine blades with porous cooling
A82-11446
Thermal-barrier-coated turbine blade study
[NASA-CR-165351] N82-10040
A new method of cooling turbine vanes
N82-11027
New molding method of three-dimensional hollow photoelastic model and centrifugal stress analysis of air cooled turbine blade model
[NAL-TR-427T] N82-11067

TURBINE ENGINES
Superalloy turbine components - Which is the superior manufacturing process, as-HIP, HIP plus Isoforge, or 'gatorizing' of extrusion consolidated billet
A82-12497
Superalloy powder engine components; controls employed to assure high quality hardware
A82-12499
Development of multivariable controllers for aircraft turbine engines
N82-11087

TURBOCOMPRESSORS
Wind tunnel tests on airfoils in tandem cascade
A82-10987
An aerodynamic design method for transonic axial flow compressor stage
N82-10984
Initial experimental research into the response of turbojet engine compressors to distortion of intake pressure
N82-11006
An experimental investigation of the rotating stall, surge and wake behind the rotor for a single stage axial compressor
N82-11008
A theoretical analysis of the stream surface of revolution with supersonic inlet flow in a transonic axial compressor
N82-11025

TURBOFAN ENGINES
Rotor wake characteristics relevant to rotor-stator interaction noise generation
[AIAA PAPER 81-2031] A82-10456
Application of numerical modeling to gas turbine combustor development problems
A82-12118
An assessment of the use of antimisting fuel in turbofan engines
[NASA-CR-165258] N82-11230

TURBOJET ENGINES
Study of reingestion of exhaust gases with different initial temperature in a reversed turbojet engine
A82-11444
Initial experimental research into the response of turbojet engine compressors to distortion of intake pressure
N82-11006
A preliminary experimental investigation of the response of a turbojet engine to inlet pressure distortion
N82-11007

TURBOMACHINE BLADES
Calculation of natural modes of vibration for rotor blades by the finite element method
[DFVLR-FB-81-07] N82-10452

TURBOMACHINERY
Acta mechanica sinica
[AD-A105184] N82-11014
The arbitrary quasi-orthogonal surface method for computing three-dimensional flow in turbine machinery. 2. Calculation of the three-dimensional flow with the S sub 1-surface twisted
N82-11015

TURBOPROP ENGINES
Propulsion study for Small Transport Aircraft Technology (STAT)
[NASA-CR-165499] N82-10037

TURBULENT BOUNDARY LAYER
Theoretical investigations and experimental researches for higher subsonic two-dimensional compressor cascade
N82-11024

TURBULENT FLOW
Multiple-scale turbulence modeling of free turbulent flows
[ASME PAPER 81-FE-20] A82-10934
On the prediction of swirling flowfields found in axisymmetric combustor geometries
A82-12120
Validation studies of turbulence and combustion models for aircraft gas turbine combustors
A82-12267
A new method of cooling turbine vanes
N82-11027
Wind-tunnel results for a modified 17-percent-thick low-speed airfoil section
[NASA-TP-1919] N82-11033
A numerical three-dimensional turbulent simulation of a subsonic VSTOL jet in a cross-flow using a finite element algorithm
[AD-A104514] N82-11055

TURBULENT WAKES
Reductions in parachute drag due to forebody wake effects
[AIAA PAPER 81-1939] A82-10417
Rotor wake characteristics relevant to rotor-stator interaction noise generation
[AIAA PAPER 81-2031] A82-10456

TWO DIMENSIONAL FLOW
Control laws for adaptive wind tunnels
A82-10985
An aerodynamic design method for transonic axial flow compressor stage
N82-10984
Theoretical investigations and experimental researches for higher subsonic two-dimensional compressor cascade
N82-11024

U

UH-1 HELICOPTER
Helicopter icing spray system - Improvements and flight experience
A82-12696

ULTRAHIGH FREQUENCIES
A mathematical model of an over-sea airborne UHF radio link
A82-11406

UNDERCARRIAGES
Analytical determination of undercarriage retraction kinematics
A82-10364

UNSTEADY FLOW
An experimental investigation of the rotating stall, surge and wake behind the rotor for a single stage axial compressor
N82-11008

UPPER SURFACE BLOWING
Quiet short-haul research aircraft familiarization document, revision 1
[NASA-TM-81298] N82-10031

V

V/STOL AIRCRAFT
V/STOL aircraft and fluid dynamics
[NASA-TM-81328] N82-10029
Low speed testing of the inlets designed for a tandem-fan V/STOL nacelle --- conducted in the Lewis 10 by 10 foot wind tunnel
[NASA-TM-82728] N82-11042
A summary of V/STOL inlet analysis methods
[NASA-TM-82725] N82-11043
A numerical three-dimensional turbulent simulation of a subsonic VSTOL jet in a cross-flow using a finite element algorithm
[AD-A104514] N82-11055

VARIABILITY
Characteristic and principal gains and phases and their use as multivariable control design tools --- generalizing Nyquist and root-locus diagram techniques
N82-10050
Multivariable design techniques based on singular value generalizations of classical control
N82-10051

VELOCITY DISTRIBUTION
Aerodynamic calculations and design of subcritical aerofoils
N82-10983

VELOCITY MEASUREMENT
Hard limited approaches to correlation velocity sensing
A82-12636

VERTICAL AIR CURRENTS
Downbursts and microbursts - An aviation hazard --- downdrafts beneath thunderstorms
A82-10214

VERTICAL DISTRIBUTION
Determination of vertical profiles of aerosol size spectra from aircraft radiative flux measurements. II - The effect of particle nonsphericity
A82-12149

VERY LOW FREQUENCIES
Omega station 10.2 kHz signal selection made easy
A82-12638

VIBRATION DAMPING
'Quiet please' --- aircraft hydraulic systems noise reduction
A82-10854
Polyurethane foams for aircraft shock mounts. 3: Vibration damping by polyether foams
[AD-A104496] N82-11212

VIBRATION EFFECTS
The Shock and Vibration Digest, volume 13, no. 9
[AD-A105062] N82-10421

VIBRATION ISOLATORS
The possibility of using deformable rubber components in landing gear
A82-10496
Polyurethane foams for aircraft shock mounts. 3: Vibration damping by polyether foams
[AD-A104496] N82-11212

VIBRATION MODE
Applications of finite element method in aerospace power systems design
A82-11717
Calculation of natural modes of vibration for rotor blades by the finite element method
[DFVLR-FB-81-07] N82-10452

VIBRATION TESTS
The Shock and Vibration Digest, volume 13, no. 9
[AD-A105062] N82-10421

VIBRATORY LOADS
Lineup of the IM-series aircraft-derivative gas turbines
A82-12560

VIDEO EQUIPMENT
Tangential sensitivity of EW receivers
A82-11020

VISCOUS FLOW
Strong matching method for computing transonic viscous flows including wakes and separations - Lifting airfoils
A82-10821

VORTEX FLAPS
Effects of vortex flaps on the low-speed aerodynamic characteristics of an arrow wing
[NASA-TP-1914] N82-11013

VORTICES
Increasing the lift/drag ratio of a flat delta wing
A82-11899
The CIVIC - A concept in vortex induced combustion. II
[ASME PAPER 81-GT-12] A82-11997

W

WALL FLOW
Control laws for adaptive wind tunnels
A82-10985

WARNING SYSTEMS
An airport wind shear detection and warning system using Doppler radar
A82-10220
Threat Alert and Collision Avoidance System (TCAS) Symposium
[AD-A104563] N82-11047

WAVE DIFFRACTION
Acta mechanica sinica
[AD-A105184] N82-11014

WAVE REFLECTION
Acta mechanica sinica
[AD-A105184] N82-11014

WEAPON SYSTEMS
Quantification of the thermal environment for externally carried aircraft stores and ordnance
A82-12103

WEATHER FORECASTING
Operational environment, meteorological conditions and weather forecasting
N82-11057

WIND DIRECTION
Gust front structure observed by Doppler radar
A82-10223

WIND MEASUREMENT
Detection and display of wind shear and turbulence
A82-10222

WIND SHEAR
An airport wind shear detection and warning system using Doppler radar
A82-10220
Instrumented aircraft verification of clear-air radar detection of low-level wind shear
A82-10221
Detection and display of wind shear and turbulence
A82-10222
Comparative study of flare control laws
[NASA-CR-164903] N82-10032

WIND TUNNEL DRIVES
Design predictions for noise control in the cryogenic National Transonic Facility
A82-12025

WIND TUNNEL TESTS
A modular asymmetric parachute for wind tunnel testing
[AIAA PAPER 81-1933] A82-10414
Stress measurements in a ribbon parachute canopy during inflation and at steady state
[AIAA PAPER 81-1944] A82-10420
Wind tunnel tests on airfoils in tandem cascade
A82-10987
Standard tests of a research model rotor in a wind tunnel, including model similarity --- calculations compared with measurements
[BMVG-FBWT-79-16] N82-10016
Experimental investigations of the separated flow around a rectangular wing --- in a wind tunnel
[DFVLR-FB-81-12] N82-10017
Effects of vortex flaps on the low-speed aerodynamic characteristics of an arrow wing
[NASA-TP-1914] N82-11013
Wind-tunnel results for a modified 17-percent-thick low-speed airfoil section
[NASA-TP-1919] N82-11033
Icing tunnel tests of a composite porous leading edge for use with a liquid anti-ice system --- Lewis icing research tunnel
[NASA-CR-164966] N82-11052
Subsonic cascade wind tunnel tests using a compressor configuration of DCA blades
[AD-A104597] N82-11069

Helicopter rotor trailing edge noise --- noise prediction
[NASA-CR-3470] N82-11859

WIND TUNNEL WALLS

Control laws for adaptive wind tunnels
A82-10985

On low-speed wind tunnels with deformable boundaries
A82-11462

WIND TUNNELS

Evaluation of the acoustic measurement capability of the NASA Langley V/STOL wind tunnel open test section with acoustically absorbent ceiling and floor treatments
[NASA-CR-165796] N82-10059

WIND VELOCITY

Gust front structure observed by Doppler radar
A82-10[illegible]3

WINDSHIELDS

Design analysis of high temperature transparent windshields for high performance aircraft
[ASME PAPER 81-ENAS-5] A82-10693

WING FLAPS

Increasing the lift:drag ratio of a flat delta wing
A82-11899

WING FLOW METHOD TESTS

Experimental study of subsonic and transonic flows past a wing
A82-10363

WING LOADING

Nonlinear prediction of subsonic aerodynamic loads on wings and bodies at high angles of attack
A82-11359

On the question of trailing airplane motion
A82-11470

A study on numerical method for evaluating spanwise integral in subsonic lifting-surface theory
[NAL-TR-661T] N82-11035

Aeroacoustic theory for noncompact wing-gust interaction
[FDRL-81-7] N82-11071

WING OSCILLATIONS

Experimental study of empennage snap-through vibrations
A82-11471

WING PANELS

Formation of triangular-element stiffness matrix using sliding interpolation
A82-11464

WING PROFILES

An influence coefficient method for the application of the modal technique to wing flutter suppression of the DAST ARW-1 wing
[NASA-CR-165772] N82-11070

WING ROOTS

Acta mechanica sinica
[AD-A105186] N82-11014

The principles and methods for shaping the wing root regions of a wing-body combination at transonic and lower supersonic speeds
N82-11016

WING TANKS

Experimental study of fuel heating at low temperatures in a wing tank model, volume 1
[NASA-CR-165391] N82-11224

WINGS

Aircraft wing trailing-edge noise
[NASA-CR-164952] N82-11039

On the kernel function collocation method in steady subsonic flow for wing with control surfaces
N82-12023

X

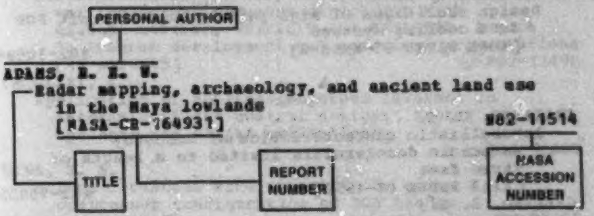
X WING ROTORS

An investigation of a stoppable helicopter rotor with circulation control --- ames 40 by 80 foot wind tunnel
[NASA-TM-81218] N82-10030

PERSONAL AUTHOR INDEX

AERONAUTICAL ENGINEERING/*A Continuing Bibliography (Suppl. 145)* FEBRUARY 1982

Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the title, e.g., N82-11514. Under any one author's name the accession numbers are arranged in sequence with the *IAA* accession numbers appearing first.

A

ADAM, V.
Control law design for transport aircraft flight tasks
N82-11080

ADAMS, R. E. W.
Radar mapping, archaeology, and ancient land use in the Maya lowlands
[NASA-CR-164931] N82-11514

AGLIULLIN, I. N.
Basic problem of aircraft gasturbine engine analytic design. II
A82-11463

AKENTEV, V. G.
Calculation of aerodynamic characteristics of jet flapped airplane
A82-11459

AKHTER, M. M.
Development of multivariable controllers for aircraft turbine engines
N82-11087

AKHTIAMOV, E. V.
Study of reingestion of exhaust gases with different initial temperature in a reversed turbojet engine
A82-11464

ALBRIGHT, A. E.
Icing tunnel test of a glycol-exuding porous leading edge ice protection system on a general aviation airfoil
[NASA-CR-165444] N82-10021

ALLRAMSEDER, H.
Standard tests of a research model rotor in a wind tunnel, including model similarity
[BMVG-FBWT-79-16] N82-10016

ALM, A.
Lightning effects on aircraft and composites. Literature study on lightning strikes and protection
[FOA-C-20388-F3] N82-10024

AMIET, R. K.
Helicopter rotor trailing edge noise
[NASA-CR-3470] N82-11859

AMIET, R. K.
Helicopter rotor trailing edge noise
[AIAA PAPER 81-2001] A82-10455

ANDERSON, S. B.
V/STOL aircraft and fluid dynamics
[NASA-TM-81328] N82-10029

ANDO, Y.
New estimation method for flutter or divergence boundary from random responses at subcritical speeds
[NAL-TR-667T] N82-11034

ANDRIANO, N.
Air-freon integrated environmental conditioning system for trainer subsonic aircraft
[ASME PAPER 81-ENAS-33] A82-10920

ARCHDEACON, J. L.
KC-135 Avionics Modernization Hot Bench
[AIAA 81-2105] A82-10081

ARIFULIN, A. C.
Jet fuel from carbon
A82-12021

ASHER, R.
A solution to the static geometry problem for JTIDS relative navigation
A82-12634

ATKINSON, G. F.
Air supply system bite for Boeing 767 airplane
[ASME PAPER 81-ENAS-7] A82-10895

B

BABISH, C. A., III
Design analysis of high temperature transparent windshields for high performance aircraft
[ASME PAPER 81-ENAS-5] A82-10893

BACHMAN, K. L.
Ring Laser Gyro Navigator /RLGN/ flight test results
A82-12644

BAILEY, C. D.
Acoustic emission - An emerging technology for assessing fatigue damage in aircraft structure
A82-11149

BAILEY, R. E.
Analysis of augmented aircraft flying qualities through application of the Neal-Smith criterion
[AIAA PAPER 81-1776] A82-10462

BAKER, A. J.
A numerical three-dimensional turbulent simulation of a subsonic VSTOL jet in a cross-flow using a finite element algorithm
[AD-A104514] N82-11055

BALASUBRAMANIAN, T. S.
Numerical treatment of helicopter rotor stability problems
A82-12045

BALBUKH, V. V.
Control of electromechanical actuator elements for flight vehicles
A82-12170

BALLARD, J. D.
An investigation of a stoppable helicopter rotor with circulation control
[NASA-TM-81218] N82-10030

BALOMBIN, J. R.
Rotor wake characteristics relevant to rotor-stator interaction noise generation
[AIAA PAPER 81-2031] A82-10456

BARDE, L.
Quantification of the thermal environment for externally carried aircraft stores and ordnance
A82-12100

BATTERSON, J. G.
Determination of airplane model structure from flight data by using modified stepwise regression
[NASA-TP-1916] N82-10041
Estimation of airplane stability and control derivatives from large amplitude longitudinal maneuvers
[NASA-TM-83185] N82-10042

BEASLEY, W. D.
Wind-tunnel results for a modified 17-percent-thick low-speed airfoil section
[NASA-TP-1919] N82-11033
BELTE, D.
Helicopter icing spray system - Improvements and flight experience
A82-12696
BERKOVITS, A.
Fatigue life of lugs under service loading - Test results and predictions
A82-11685
BICKLER, T. C.
Synthetic aperture radar target simulator
[NASA-CASE-NPO-15024-1] N82-10286
BIPPES, H.
Experimental investigations of the separated flow around a rectangular wing
[DFVLR-FB-81-12] N82-10017
BIRCH, S. A.
The constricted rigging line trials technique for assessing the opening characteristics of parachutes
[AIAA PAPER 81-1932] A82-10413
BIRD, H.
Flight trajectory control investigation
[AD-A104542] N82-11048
BJERKAAS, C. L.
Gust front structure observed by Doppler radar
A82-10223
BJORKLUND, R. C.
Interoperability testing of decentralized command, control, communications and intelligence /C3I/ systems
[AIAA 81-2205] A82-10143
BLICK, E. F.
An airport wind shear detection and warning system using Doppler radar
A82-10220
BOCKSTAHLER, A. J.
Design analysis of high temperature transparent windshields for high performance aircraft
[ASME PAPER 81-ENAS-5] A82-10893
BOEHRINGER, W. E.
High-efficiency hydraulic power transfer units for multisystem aircraft
A82-10853
BOLTON, W. R.
Development of new lifting parachute designs with increased trim angle
[AIAA PAPER 81-1921] A82-10407
BONHAM, A. J.
System safety program plan
[AD-A104557] N82-11354
BORELLO, L.
Problems relating to the classical rate-gyro
A82-10497
BOROVIK, V. O.
Basic problem of aircraft gasturbine engine analytic design. II
A82-11463
BOROWSKY, M. S.
Relationships between naval aviation safety and pilot flight experience
A82-11031
BRADFIELD, R. N.
Procedures and analysis techniques for determining static air minimum control speeds
A82-12564
BRADSHAW, J. E.
Advanced fuel flowmeter for future naval aircraft
[AD-A104364] N82-11063
BREWER, G. D.
Fuel for future transport aircraft
[ASME PAPER 81-HT-80] A82-10965
BROUWERS, A. P.
Lightweight diesel engine designs for commuter type aircraft
[NASA-CR-165470] N82-11068
BROWN, W. E., JR.
Radar mapping, archaeology, and ancient land use in the Maya lowlands
[NASA-CR-164931] N82-11514
BRUERE, A.
Electrical ground testing of aircraft antistatic protection
A82-10822
BRYSON, A. E., JR.
An overview of optimal control in aerospace systems
N82-11074
BUCH, A.
Fatigue life of lugs under service loading - Test results and predictions
A82-11685
BUCKER, H. O.
Inflatable system for fast deployment of parachutes at low altitudes from slow moving aircraft or stationary supports
[AIAA PAPER 81-1953] A82-10428
BUCKINGHAM, R. D.
Design challenges of high performance aircraft POD EOCM cooling systems
[ASME PAPER 81-ENAS-6] A82-10894

C

CALIANNO, C. T.
Aeroballistic characteristics of sonobuoy parachute decelerators limited to a length of three feet
[AIAA PAPER 81-1950] A82-10425
CALLIZO, L. A.
HiMAT onboard flight computer system architecture and qualification
[AIAA 81-2107] A82-10082
CAMP, D. W.
An airport wind shear detection and warning system using Doppler radar
A82-10220
CAMPBELL, G. S.
A note on fatal aircraft accidents involving metal fatigue
A82-11400
CAN, S.
Structural analysis of fuselages with cutouts by finite element method
N82-10995
CAPRILE, C.
The possibility of using deformable rubber components in landing gear
A82-10496
CARBONE, R.
Detection and display of wind shear and turbulence
A82-10222
CARLSON, L. A.
A new thermal and trajectory model for high altitude balloons
[AIAA PAPER 81-1926] A82-10411
CARTER, A. H., JR.
A comprehensive bibliography of literature on helicopter noise technology
[AD-A103331] N82-10812
CASSIER, A.
Development of the Triflex rotor head
A82-11222
CENTER, J. L.
Navigation task partitioning in distributed-processing avionics systems
A82-10646
CHAMIS, C. C.
Integrated analysis of engine
[NASA-TM-82713] N82-11491
CHANGSHENG, Z.
An experimental investigation of the rotating stall, surge and wake behind the rotor for a single stage axial compressor
N82-11008
CHAOQIANG, L.
Second order approximation theory of an arbitrary aerofoil in compressible potential flow
N82-10982
Aerodynamic calculations and design of subcritical aerofoils
N82-10983
CHAPMAN, R. E.
Hard limited approaches to correlation velocity sensing
A82-12636
CHATTERJEE, J. S.
General aviation aircraft antennas for the global positioning system
[NASA-TM-83212] N82-11339

CHEN, C.
Superalloy turbine components - Which is the superior manufacturing process, as-HIP, HIP plus Isoforge, or 'gatorizing' of extrusion consolidated billet
A82-12497

CHIA, F. I.
The principles and methods for shaping the wing root regions of a wing-body combination at transonic and lower supersonic speeds
N82-11016

CHOU, Y. T.
Structural analysis computer programs for rigid multicomponent pavement structures with discontinuities, WESLIQID and WESLAYER. Report 1: Program development and numerical presentations
[AD-A104545] N82-11498

CICOLANI, L.
Application of nonlinear systems inverses to automatic flight control design: System concepts and flight evaluations
N82-11083

CINA, F. S.
Subsonic cascade wind tunnel tests using a compressor configuration of DCA blades
[AD-A104597] N82-11069

CLARK, J. F.
The evolution of airborne weather avoidance radar toward a calibrated remote rain gauge using REACT
A82-10225

CLINE, M. C.
Computation of high Reynolds number internal/external flows
[NASA-TM-84049] N82-11046

COCKRELL, D. J.
Aerodynamics and performance of cruciform parachute canopies
[AIAA PAPER 81-1919] A82-10405
Experimental determination of parachute apparent mass and its significance in predicting dynamic stability
[AIAA PAPER 81-1920] A82-10406

COUTS, W. H.
Superalloy turbine components - Which is the superior manufacturing process, as-HIP, HIP plus Isoforge, or 'gatorizing' of extrusion consolidated billet
A82-12497

COWLEY, M.
Wings in the sun - The evolution of Solar Challenger
A82-12694

COX, S. K.
Determination of vertical profiles of aerosol size spectra from aircraft radiative flux measurements. II - The effect of particle nonsphericity
A82-12149

COYNE, J.
Superalloy turbine components - Which is the superior manufacturing process, as-HIP, HIP plus Isoforge, or 'gatorizing' of extrusion consolidated billet
A82-12497

COYNE, J. E.
Superalloy powder engine components; controls employed to assure high quality hardware
A82-12499

CROLL, R. H.
A modular asymmetric parachute for wind tunnel testing
[AIAA PAPER 81-1933] A82-10414

CROW, R. P.
Discrete address beacon, navigation and landing system
A82-10650

CULBERT, T. P.
Radar mapping, archaeology, and ancient land use in the Maya lowlands
[NASA-CR-164931] N82-11514

CZYZEWSKI, K.
The use of the Weber method for minicomputer-assisted numerical analysis of airfoils
A82-10362

D

DAGENHART, J. R.
Amplified crossflow disturbances in the laminar boundary layer on swept wings with suction
[NASA-TP-1902] N82-11391

DAGOSTINO, V.
New separators for battery systems
A82-11715

DAINTY, R. V.
Fractographic determination of fatigue crack growth rates in aircraft components
A82-12697

DEGANI, O.
Development and evaluation of automatic landing control laws for light wing loading STOL aircraft
[NASA-CR-166160] N82-10043

DEGUEST, P.
Adaptation of a turbine test facility to high-temperature research
[RAE-LIB-TRANS-2064] N82-11089

DEHOFF, R. L.
Development of multivariable controllers for aircraft turbine engines
N82-11007

DESARO, R.
An assessment of the use of antimisting fuel in turbofan engines
[NASA-CR-165258] N82-11230

DEZIDEREV, S. G.
Results of experimental study of heat transfer to turbine blades with porous cooling
A82-11446

DI-YI, T.
Initial experimental research into the response of turbojet engine compressors to distortion of intake pressure
N82-11006
A preliminary experimental investigation of the response of a turbojet engine to inlet pressure distortion
N82-11007

DINQIAN, W.
Finite difference computation of the steady transonic potential flow around airplanes
N82-10981

DIGIACINTO, T.
Airborne associative processor /ASPRO/
[AIAA 81-2145] A82-10104

DIPASQUO, R. S.
The integrated inertial sensor assembly /IISA/ - A redundant strapdown system for advanced aircraft navigation and flight control functions
A82-12602

DONALDSON, R. J., JR.
Gust front structure observed by Doppler radar
A82-10223

DOVIAK, R. J.
An airport wind shear detection and warning system using Doppler radar
A82-10220
Instrumented aircraft verification of clear-air radar detection of low-level wind shear
A82-10221

DOWELL, E. H.
Control laws for adaptive wind tunnels
A82-10985

DOYLE, J. C.
Multivariable design techniques based on singular value generalizations of classical control
N82-10051
Limitations on achievable performance of multivariable feedback systems
N82-10052

DREITSER, G. A.
The enhancement of heat exchange in channels /2nd revised and enlarged edition/
A82-12222

DUFFY, J. V.
Polyurethane foams for aircraft shock mounts. 3: Vibration damping by polyether foams
[AD-A104496] N82-11212

DUGRANRUT, J. D.
Description of the meteorological research radar system aboard NOAA/Research Facilities Center WP-3D aircraft
A82-10217

DUNBAR, W. G.
High voltage surge and partial discharge test to evaluate aerospace equipment parts
A82-11740

DUNN, G. L.
Advanced aircraft electrical system control technology demonstrator. Phase 1: Requirements analysis and conceptual design
[AD-A103922] N82-10326

E

EARLE, R. V.
Propulsion study for Small Transport Aircraft Technology (STAT)
[NASA-CR-165499] N82-10037

EARLS, M. R.
HiMAT onboard flight computer system architecture and qualification
[AIAA 81-2107] A82-10082

EATON, H. E.
Development of low modulus material for use in ceramic gas path seal applications
[NASA-CR-165469] N82-10039

EISWIRTH, E. A.
In-situ calibration of flight heat transfer instrumentation
[ASME PAPER 81-ENAS-13] A82-10901

ELMORE, K. L.
An airport wind shear detection and warning system using Doppler radar
A82-10220
Instrumented aircraft verification of clear-air radar detection of low-level wind shear
A82-10221

ENGBLOM, J. J.
Coupled fluid/structure response predictions for soft body impact of airfoil configurations
A82-12039

EPIFANOV, V. M.
End losses in turbine cascades with porous cooling
A82-11434

EPPEL, J. C.
Quiet short-haul research aircraft familiarization document, revision 1
[NASA-TM-81298] N82-10031

ERNSTOFF, M. N.
Study and development of an integrated head-up display
[AD-A104337] N82-11062

ERZBERGER, H.
Optimum climb and descent trajectories for airline missions
N82-11082

ESPOSITO, R. J.
FAA acceptance tests on the NAVSTAR GPS Z-Set receiver
A82-12639

EVERETT, W. H.
Superalloy powder engine components; controls employed to assure high quality hardware
A82-12499

F

FABRIS, G.
Multiple-scale turbulence modeling of free turbulent flows
[ASME PAPER 81-FE-20] A82-10934

FANGYIAN, Z.
An aerodynamic design method for transonic axial flow compressor stage
N82-10984

FEDORAK, R.
Memory requirements for future navigation systems
A82-12637

FEIDA, F.
An aerodynamic design method for transonic axial flow compressor stage
N82-10984

FEINREICH, B.
Development and evaluation of automatic landing control laws for light wing loading STOL aircraft
[NASA-CR-166160] N82-10043

FERKO, E. J.
Crack growth evaluation of a method to convert real-time loads history to a simplified engineering spectra
A82-12043

FIORENTINO, A.
An assessment of the use of antimisting fuel in turbofan engines
[NASA-CR-165258] N82-11230

FITZGERALD, R. E.
Developments in boundary layer Thrust Vector Control
A82-10855

FITZSIMMONS, R. D.
How large should a commuter transport be
[AIAA PAPER 81-1732] A82-10463

FORSYTH, T. J.
An investigation of a stoppable helicopter rotor with circulation control
[NASA-TM-81218] N82-10030

FRANCIS, B. A.
Feedback and minimax sensitivity
N82-10058

FRANCOIS, J.
Adaptation of a turbine test facility to high-temperature research
[RAE-LIB-TRANS-2064] N82-11089
Effects of aircraft noise on the equilibrium of airport residents: Testing and utilization of a new methodology
[NASA-TM-76628] N82-11636

FRANZ, T.
An assessment of the use of antimisting fuel in turbofan engines
[NASA-CR-165258] N82-11230

FREYMANN, R.
A method for determination of the aeroelastic behavior of aircraft with active control systems
[DFVLR-FB-81-05] N82-10047

FROST, W.
An airport wind shear detection and warning system using Doppler radar
A82-10220

FU-QUN, C.
Initial experimental research into the response of turbojet engine compressors to distortion of intake pressure
N82-11006
A preliminary experimental investigation of the response of a turbojet engine to inlet pressure distortion
N82-11007

FUJITA, T. T.
Downbursts and microbursts - An aviation hazard
A82-10214

G

GABRIELLI, G.
Characteristics and trends of energy consumption in transport missions with aircraft and surface vehicles
A82-10495

GALDA, K. H.
Mathematical model for the maintenance program of modern jet aircraft
[DFVLR-FB-81-14] N82-10002

GAONKAR, G. H.
On computing Floquet transition matrices of rotorcraft
A82-11225

GARRARD, W. L.
The effects of flexibility on the steady-state performance of small ribbon parachute models
[AIAA PAPER 81-1923] A82-10408
Stress measurements in a ribbon parachute canopy during inflation and at steady state
[AIAA PAPER 81-1944] A82-10420
Stress measurements in bias constructed parachute canopies during inflation and at steady-state
[AIAA PAPER 81-1945] A82-10421

GARRETT, W. A.
ACMA - Fact or fantasy
A82-12048

GATINEAU, R. J.
History of flight testing the L-1011 TriStar jet transport. II - Testing highlights since initial certification of the L-1011-1
A82-12049

GEISLER, D.
Experimental modal analysis of the fuselage panels of an Aero Commander aircraft
[NASA-CR-165750] N82-10028

GERSHTEIN, S. I.
Experimental study of empennage snap-through vibrations
A82-11471
GEVAERT, G.
Development and evaluation of automatic landing control laws for light wing loading STOL aircraft
[NASA-CR-166160] N82-10043
GILIAZOV, M. SH.
Study of reingestion of exhaust gases with different initial temperature in a reversed turbojet engine
A82-11444
GILL, F. R.
Design considerations for optimal flight control systems
N82-11077
GILL, J. C.
Propulsion study for Small Transport Aircraft Technology (STAT)
[NASA-CR-165499] N82-10037
GILREATH, M. C.
General aviation aircraft antennas for the global positioning system
[NASA-TM-83212] N82-11339
GIRARD, L. A., JR.
Air bag impact attenuation system for the AQM-34V remote piloted vehicle
[AIAA PAPER 81-1917] A82-10403
GLIEBE, P. R.
Effects of vane/blade ratio and spacing on fan noise
[AIAA PAPER 81-2033] A82-10457
GOETTING, H. C.
Mathematical model for the maintenance program of modern jet aircraft
[DFVLR-FB-81-14] N82-10002
GOLDBERG, H.
Extending the limits of reliability theory
A82-12310
GOLDSTEIN, R. M.
Synthetic aperture radar target simulator
[NASA-CASE-NPO-15024-1] N82-10286
GOODMAN, A. W.
Sealed lead-acid batteries for aircraft applications
A82-11716
GOODRICK, T. F.
Comparison of simulation and experimental data for a gliding parachute in dynamic flight
[AIAA PAPER 81-1924] A82-10409
GOODWIN, W. V.
An investigation of the combustion process in solid fuel ramjets
[AD-A104603] N82-11232
GORLINE, G. A.
Implementation of AVRADCOM MMST
A82-10545
GRIES, D. A.
Design considerations for duty cycle, life and reliability of small limited life engines
[AIAA PAPER 81-1402] A82-10465
GROSS, S.
Unsolved problems of nickel cadmium batteries
A82-11725
GRUZDEV, A. A.
On low-speed wind tunnels with deformable boundaries
A82-11462
GUENTHER, R.
A CFRP taileron for the Tornado: Construction and production
[MBB-FE-212/KFK/PUB/2] N82-10035
GULIAEV, V. V.
Calculation of aerodynamic characteristics of jet flapped airplane
A82-11459
GUPTA, R. R.
Omega station 10.2 kHz signal selection made easy
A82-12638
GURIANOV, A. IA.
Experimental study of empennage snap-through vibrations
A82-11471
GUSEVA, R. I.
On the use of carbon composites in slat and stabilizer construction
A82-11460
GUSKOV, V. I.
End losses in turbine cascades with porous cooling
A82-11434

H

HALLIDAY, R.
Commercial EMS considerations for small gas turbine engines
A82-12449
HANEY, H. P.
A comparison of theoretical and experimental pressure distributions for two advanced fighter wings
[NASA-TM-81331] N82-11054
HARRIS, W. L.
Model helicopter rotor impulsive noise
A82-11300
HARSHA, P. T.
Multiple-scale turbulence modeling of free turbulent flows
[ASME PAPER 81-FE-20] A82-10934
HARTMANN, U.
Practical design and realization of a digital adaptive flight control system
N82-11079
HARTMANN, H.
A CFRP taileron for the Tornado: Construction and production
[MBB-FE-212/KFK/PUB/2] N82-10035
HASHIMOTO, R.
New molding method of three-dimensional hollow photoelastic model and centrifugal stress analysis of air cooled turbine blade model
[NAL-TR-427T] N82-11067
HAWKES, D. J.
The certification of digital systems
A82-11940
HAWLEY, D. L.
Three navigation systems and their costs of acquiring remote sensing data
A82-10049
HEDGLEY, D. R.
Solution to the hidden-line problem
A82-12803
HELD, D. N.
Synthetic aperture radar target simulator
[NASA-CASE-NPO-15024-1] N82-10286
HICKS, R. M.
A comparison of theoretical and experimental pressure distributions for two advanced fighter wings
[NASA-TM-81331] N82-11054
HILDEBRAND, P. H.
Multiple Doppler radar observations of PBL structure
A82-10292
HILDEBRANT, R. V.
Variable speed constant frequency /VSCF/ electrical system cuts cost of ownership
A82-11719
HILL, W., JR.
The case for a defensive air-to-air fighter
A82-12801
HILLIG, W. B.
Thermal-barrier-coated turbine blade study
[NASA-CR-165351] N82-10040
HODGSON, T. H.
Aircraft wing trailing-edge noise
[NASA-CR-164952] N82-11039
HOLL, R.
Further application and development of an engine usage/life monitoring system for military services
A82-12450
HOLLAND, R. L.
The statistical theory of radio direction finding
[AD-A108156] N82-10027
HOLT, I. T.
Development of new lifting parachute designs with increased trim angle
[AIAA PAPER 81-1921] A82-10407
HONG-KUN, Z.
A new method of cooling turbine vanes
N82-11027
HONG, Q.
Finite difference computation of the steady transonic potential flow around airplanes
N82-10981
HOPKINS, J. J.
Integrated satellite navigation and strapdown attitude and heading reference systems for civil air carriers
A82-12643

HORN, W. J.
A new thermal and trajectory model for high altitude balloons
[AIAA PAPER 81-1926] A82-10411
HUBBARD, J. E., JR.
Model helicopter rotor impulsive noise

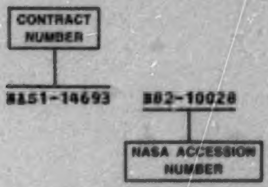
CONTRACT NUMBER INDEX

AERONAUTICAL ENGINEERING / *A Continuing Bibliography (Suppl. 145)* FEBRUARY 1982

Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the *IAA* accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the *IAA* or *STAR* section.

AERONAUTICAL ENGINEERING

A CONTINUING BIBLIOGRAPHY WITH INDEXES

(Supplement 146)

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in February 1982 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA).*

NASA Scientific and Technical Information Branch 1982
National Aeronautics and Space Administration
Washington, DC

This supplement is available as NTISUB 141 093 from the National Technical Information Service (NTIS), Springfield, Virginia 22161 at the price of $5.00 domestic; $10.00 foreign.

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971.

This supplement to *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 442 reports, journal articles, and other documents originally announced in February 1982 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries*, in that order. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* and *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes -- subject, personal author, and contract number -- are included.

An annual cumulative index will be published.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A82-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at $8.00 per document. Microfiche[1] of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand, and at the rate of $1.35 per microfiche for standing orders for all *IAA* microfiche.

Minimum air-mail postage to foreign countries is $2.50 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications

STAR ENTRIES (N82-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26.1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

ICING TUNNEL TEST OF A GLYCOL-EXUDING POROUS LEADING EDGE ICE PROTECTION SYSTEM ON A GENERAL AVIATION AIRFOIL Final Report
David L. Kohlman, William G. Schweikhard, and Alan E. Albright
Sep. 1981 37 p refs
(Grant NAG3-71)
(NASA-CR-165444; KU-FRL-464-1) Avail: NTIS
HC A03/MF A01 CSCL 01C

Test results show that the system is very effective in preventing ice accretion (anti-ice mode) or removing ice from an airfoil. Minimum glycol flow rates required for antiicing are a function of velocity, liquid water content in the air, ambient temperature, and droplet size. Large ice caps were removed in only a few minutes using anti-ice flow rates, with the shed time being a function of the type of ice, size of the ice cap, angle of attack, and glycol flow rate. Wake surveys measurements show that no significant drag penalty is associated with the installation or operation of the system tested. T.M.

A82-11317 # **Development of aircraft production engineering discipline at IIT, Bombay.** N. K. Naik (Indian Institute of Technology, Bombay, India). *Aeronautical Society of India, Journal,* vol. 31, Feb.-Nov. 1979, p. 119-125.

The aircraft production engineering courses offered at the Indian Institute of Technology, in Bombay, are discussed. To demonstrate the value of the courses, the fundamentals of aircraft production are outlined, the discussion being confined to airframe production. The loft-template method is described, and the principal loft-template scheme used in aircraft production is shown. Also described are the theory and laboratory courses offered at the institute. C.R.

AERONAUTICAL ENGINEERING

A Continuing Bibliography (Suppl. 146)

MARCH 1982

IAA ENTRIES

A82-12987 **Creep and aero gas turbine design.** R. E. Jenkins (Rolls-Royce, Ltd., Aero Div., Bristol, England). In: International Conference on Engineering Aspects of Creep, Sheffield, England, September 15-19, 1980, Proceedings. Volume 1. London, Mechanical Engineering Publications, Ltd., 1980, p. 251-258.

Considerations given to creep in the design of aero gas turbines are reviewed. The basic requirements dictating the creep design of aero gas turbines are the attainment of the highest possible cycle temperature, consistent with the turbine cooling technology and the turbine life, and the maintenance of critical dimensions, such as clearance between rotating and static parts, throughout the service life. The importance of temperature assessment and definition and detailed analysis of typical flights is emphasized. V.L.

A82-13016 **ATARK laser tracking system.** R. Grimes and D. Baxter (Contraves Goerz Corp., Pittsburgh, PA). In: Electro-optics/Laser 80 Conference and Exposition, Boston, MA, November 19-21, 1980, Proceedings. Chicago, Industrial and Scientific Conference Management, Inc., 1980, p. 255-267.

The Automatic Tracking and Ranging Kit (ATARK) is a modular pulsed laser transceiver and electronics system suitable for a wide range of instrumentation requirements found in current programs at test ranges. The primary criterion has been to provide a system with the highest single data point accuracy. Key features of the tracker are modular construction, with processor/software control, operation at 1.06 micron, dual lamp cavity, variable pulse rate, coaxial TV system for visual record/viewing, and linear tracking error over the field of view. Using retroreflectors, the ATARK system is operational to ranges in excess of 100,000 feet and provides range data of one foot with measured tracking error of 100 microradians accuracy. P.T.H.

A82-13020 **Options for GTE precision automated tracking system.** D. Stark (GTE Sylvania, Inc., Mountain View, CA). In: Electro-optics/Laser 80 Conference and Exposition, Boston, MA, November 19-21, 1980, Proceedings. Chicago, Industrial and Scientific Conference Management, Inc., 1980, p. 302-306.

The overall design and performance of the basic PATS (Precision Automated Tracking System) and recently incorporated new features are discussed. The target tracking subsystem of PATS is a 100 pulses-per-second, 15 ns pulse-width laser transmitter and optical receiver mounted on an elevation-over-azimuth tracking mount. A quadrant photodetector is used in conjunction with an amplitude monopulse receiver to develop boresight error data. These data drive the servo system which keeps the laser pointed at the target. The absolute accuracy in azimuth and elevation is better than 0.1 milliradians, the maximum dynamics is 2.0 rad/sec, with an acceleration of 500 milliradians/sq sec. The new features include dual mode capability and automatic camera focus. V.L.

A82-13077 * **Darboux points in minimum-fuel aircraft landing problems.** E. Kreindler and F. Neuman (NASA, Ames Research Center, Moffett Field, CA). In: Joint Automatic Control Conference, Charlottesville, VA, June 17-19, 1981, Proceedings. Volume 1. New York, American Institute of Chemical Engineers, 1981, 5 p. (WA-1A). 13 refs.

An algorithm for suboptimal flight paths is used to show the existence of Darboux points on extremals of a fourth-order minimum-fuel horizontal aircraft landing problem; the states are two position coordinates, velocity and heading. It is shown that there is no simple relationship between Darboux points and conjugate points for a special second-order case of capturing a line at constant velocity. B.J.

A82-13078 **Fuel efficient flight profiles in an ATC flow management environment.** R. W. Schwab (Boeing Commercial Airplane Co., Seattle, WA). In: Joint Automatic Control Conference, Charlottesville, VA, June 17-19, 1981, Proceedings. Volume 1. New York, American Institute of Chemical Engineers, 1981, 6 p. (WA-1B).

The Flow Management research program was established to define the airborne navigation/guidance capabilities needed for efficient operation in the ATC Flow Management system under development; the Flow Management research is one element of the NASA Terminal Configured Vehicle program. This paper examines the Flow Management algorithms, and reviews in-plane geometry and ATC constraints, wind and temperature modeling, descent initialization, runway profile descent calculation, aeroperformance envelope determination, high profile descent calculation, and holding and path stretching. B.J.

A82-13079 * **A decoupled control system for improved flight performance in wind shear.** G. K. Miller, Jr. (NASA, Langley Research Center, Hampton, VA). In: Joint Automatic Control Conference, Charlottesville, VA, June 17-19, 1981, Proceedings. Volume 1. New York, American Institute of Chemical Engineers, 1981. 9 p. (WA-1D). 9 refs.

A fixed-base simulation study has been made to compare the approach and landing performance of a decoupled longitudinal control system and the velocity-vector control-wheel steering (VCWS) system that currently exists on the NASA Terminal Configured Vehicle (TCV). The decoupled control system employed constant prefilter and feedback gains to provide steady-state decoupling of flight-path angle, pitch angle, and forward velocity using symmetric spoilers, throttle, and elevator as active control elements. In severe wind shear, of the Kennedy-type, the decoupled control system improved both approach performance and touchdown performance even when the spoiler deflection was limited to 16 deg. On a 10-point rating scale, three research pilots rated the approach and landing task with decoupled controls as much as 3 to 4 increments better than the use of the VCWS system in severe winds. (Author)

A82-13088 **A dual input actuator for fluidic backup flight control.** M. F. Cycon, Jr. (Garrett Corp., Pneumatic Systems Div., Phoenix, AZ). In: Joint Automatic Control Conference, Charlottesville, VA, June 17-19, 1981, Proceedings. Volume 1. New York, American Institute of Chemical Engineers, 1981. 8 p. (WA-5B). 5 refs.

This paper describes the application of pneumatic fluidics to obtain closed-loop position control of a high-pressure, direct-drive, electrohydraulic actuator. The fluidic control, which requires no electrical power, is a backup to the primary electronic control. Tests conducted using a prototype fluidic circuit demonstrate the feasibility of a dual input (electronic-fluidic) actuator using technologically dissimilar redundant control methods. (Author)

A82-13093 **Digital redesign of existing multiloop continuous control systems.** K. S. Rattan (Wright State University, Dayton, OH). In: Joint Automatic Control Conference, Charlottesville, VA, June 17-19, 1981, Proceedings. Volume 1. New York, American Institute of Chemical Engineers, 1981. 8 p. (WP-1D). 9 refs. Contract No. F49620-79-C-0038.

A computer-aided method for converting existing multiloop continuous-data control systems into digital control systems is presented. Digital controllers are synthesized by matching the frequency responses of the digital control system to that of the continuous control system with a minimum weighted mean square error. Formulas for computing the parameters of the digital controllers are obtained as a result. An example of digitalizing existing continuous flight controller for the longitudinal YF-16 aircraft is considered and the results obtained are compared with those obtained by the Tustin transform. (Author)

A82-13094 **Digital control for flexible aircraft using reduced order models.** G. L. Slater and R. Kandadai (Cincinnati, University, Cincinnati, OH). In: Joint Automatic Control Conference, Charlottesville, VA, June 17-19, 1981, Proceedings. Volume 1. New York, American Institute of Chemical Engineers, 1981, 6 p. (WP-1E). 9 refs.

A control synthesis is presented for a very flexible aircraft, and the effects on performance from different types of suboptimal approximations are compared. By examining the response at varying sample rates, it is shown that there is a tradeoff between model accuracy and computational feasibility. When the computational requirements of higher-order models are considered, the slow sample rates imposed by these requirements make the reduced order model a superior controller. B.J.

A82-13106 **Comparison between the exact and an approximate feedback solution for medium range interception problems.** J. Shinar (Technion - Israel Institute of Technology, Haifa, Israel), K. H. Well, E. Berger (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für dynamik der Flugsysteme, Oberpfaffenhofen, West Germany), and M. Negrin. In: Joint Automatic Control Conference, Charlottesville, VA, June 17-19, 1981, Proceedings. Volume 1. New York, American Institute of Chemical Engineers, 1981, 6 p. (TA-1A). 14 refs.

The forced singular perturbation technique (FSPT) is compared with a multiple shooting algorithm known for its high precision. Three-dimensional medium range air-to-air interception is formulated as a minimum-time control problem, and the formal optimal solution is outlined. The FSPT model of the original problem is introduced, and the zero-order composite feedback solution is presented. Results of the comparison for a characteristic example are discussed, and the comparison of the zero-order FSPT feedback approximation to the precise MSA solution was found to be very encouraging. B.J.

A82-13107 * **On-line optimization of aircraft altitude and flight path angle dynamics.** A. J. Calise (Drexel University, Philadelphia, PA). In: Joint Automatic Control Conference, Charlottesville, VA, June 17-19, 1981, Proceedings. Volume 1. New York, American Institute of Chemical Engineers, 1981. 6 p. (TA-1B). 5 refs. Grant No. NsG-1496.

The optimization of aircraft altitude and flight path angle dynamics is addressed in a form suitable for on-line computation and control. The approach here is a direct extension of the work reported by Calise (1979), where singular perturbation methods were used to optimize position, energy and heading dynamics; it thus represents an optimal control solution that models all of the primary trajectory related dynamics. It is pointed out that the resulting algorithm can be regarded as a nonlinear feedback control law. The minimum time intercept of a fixed terminal point is used in setting the framework in which the analytical results are developed. The main theoretical result is that the dynamics, while not completely separable, can be approximated by singular perturbation methods when the control model includes relative position dynamics. C.R.

A82-13115 * **Air-to-air combat analysis - Review of differential-gaming approaches.** M. D. Ardema (NASA, Ames Research Center, Moffett Field, CA). In: Joint Automatic Control Conference, Charlottesville, VA, June 17-19, 1981, Proceedings. Volume 2. New York, American Institute of Chemical Engineers, 1981. 9 p. (TP-1B). 15 refs.

The problem of evaluating the combat performance of fighter/attack aircraft is discussed, and the mathematical nature of the problem is examined. The following approaches to air combat analysis are reviewed: (1) differential-turning differential game and (2) coplanar differential game. Selected numerical examples of these approaches are presented. The relative advantages and disadvantages of each are analyzed, and it is concluded that air combat analysis is an extremely difficult mathematical problem and that no one method of approach is best for all purposes. The paper concludes with a discussion of how the two approaches might be used in a complementary manner. (Author)

A82-13119 * **On matching the systems identification technique to the particular application.** W. T. Suit and M. H. Mayo (NASA, Langley Research Center, Hampton, VA). In: Joint Automatic Control Conference, Charlottesville, VA, June 17-19, 1981, Proceedings. Volume 2. New York, American Institute of Chemical Engineers, 1981, 8 p. (TP-4C). 21 refs.

Several maximum likelihood and multiple regression parameter estimation programs are currently being used at the Langley Research Center of the NASA to analyze aircraft flight test data. Based on this wealth of experience, the pertinent features of these programs are investigated and some of the difficulties involved in their use are discussed. By comparing computational time, data requirements and accuracy needed, a strategy for determining which program can be used to the best advantage of the flight test engineer is discussed. (Author)

A82-13120 **Determining hinge moments and empennage airload parameters from flight data for Learjet airplanes.** G. D. Park and M. H. Abla (Gates Learjet Corp., Wichita, KS). In: Joint Automatic Control Conference, Charlottesville, VA, June 17-19, 1981, Proceedings. Volume 2. New York, American Institute of Chemical Engineers, 1981. 6 p. (TP-4D). 8 refs.

Gates Learjet Corporation has utilized parameter identification techniques on flight test data in various ways to substantiate the airloads analyses used in certifying its airplanes. These analyses have concentrated primarily on the empennage and include: horizontal stabilizer rolling moment; vertical tail side load; horizontal tail actuator load; elevator, rudder and aileron pilot forces; and elevator hinge moment. Using the appropriate empennage loads results in conjunction with the results obtained from the total airplane responses, the component (wing-body, vertical tail, horizontal) airplane parameters were determined. The Taylor-Iliff computer program from NASA has been shown to be a very effective and efficient technique to substantiate airload analyses. (Author)

A82-13122 **Wing/store flutter - An active adaptive control application.** C. A. Harvey (Honeywell Systems and Research Center, Minneapolis, MN). In: Joint Automatic Control Conference, Charlottesville, VA, June 17-19, 1981, Proceedings. Volume 2. New York, American Institute of Chemical Engineers, 1981. 3 p. (FA-1A). 9 refs. Research supported by Honeywell, Inc., Contracts No. F33615-77-C-3096; No. F33615-80-C-3217.

The paper briefly summarizes the results of a recent feasibility study and progress on a wind tunnel demonstration of digital adaptive control of wing/store flutter with regard to modern fighter aircraft. The design features of such a controller are examined, including sensor selection for feedback, detection, and discrimination, and two adaptive approaches, maximum likelihood estimation and self-tuning regulation. B.J.

A82-13125 * **The design of exact nonlinear model followers.** G. Meyer (NASA, Ames Research Center, Moffett Field, CA). In: Joint Automatic Control Conference, Charlottesville, VA, June 17-19, 1981, Proceedings. Volume 2. New York, American Institute of Chemical Engineers, 1981. 7 p. (FA-3A). 16 refs.

A practical approach to the design of control systems for strongly nonlinear, multivariable, time-dependent plants is described. The structure of the control system is that of an exact model follower. The model dynamics are decoupled, linear, constant, and of the order of the plant. The plant state and controls are transformed so that the plant, when viewed through these transformations, looks like the simple model. Regulation of disturbances is accomplished by means of the transformed state and controls. Conditions for transformability into linear models, the appropriate models, and the construction of the transformations are discussed. The approach is illustrated on a trajectory autopilot for a helicopter. (Author)

A82-13128 **An approach to robust nonlinear control design.** M. K. Sain (Notre Dame, University, Notre Dame, IN) and J. L. Peczkowski (Bendix Corp., Energy Controls Div., South Bend, IN). In: Joint Automatic Control Conference, Charlottesville, VA, June 17-19, 1981, Proceedings. Volume 2. New York, American Institute of Chemical Engineers, 1981. 6 p. (FA-3D). 18 refs.

The paper examines a control philosophy that linearizes the simulation at a finite number of points over the envelope of operation, that applies linear design technique locally about each such point, and that strings all the local designs together into a global design by scheduling the resulting compensations over the envelope as a function of key physical variables, and within a broad nonlinear model following strategy. Attention is given to the relevant local model following ideas, an extension of the local comparison sensitivity concept to the model following situation, and the global model following concept. A complete illustration based on a realistic nonlinear turbojet engine simulation is presented. B.J.

A82-13142 **Fault detection for two physically separated, communicating inertial measurement units.** P. Motyka (Charles Stark Draper Laboratory, Inc., Cambridge, MA). In: Joint Automatic Control Conference, Charlottesville, VA, June 17-19, 1981, Proceedings. Volume 2. New York, American Institute of Chemical Engineers, 1981. 10 p. (FP-2B) 6 refs. Contract No. F33615-78-C-1563.

The paper develops an analytic technique for the generation of failure detection and isolation (FDI) thresholds for a tactical aircraft system with two separated IMUs. The basic problem is to select thresholds which result in the detection and isolation of failures ranging from hard (those which affect flight-control performance) through midvalue (which affect pilot display performance) and soft (which affect navigation and weapon-delivery performance). FDI is accomplished by means of the generalized likelihood test. Results are presented which show the operation of the FDI system over a realistic flight profile, which incorporates maneuvers typical of a fighter aircraft mission. B.J.

A82-13150 # **Aeronautics in China - An AIAA report.** J. Grey. New York, American Institute of Aeronautics and Astronautics (AIAA Aerospace Assessment Series. Volume 4), 1981. 201 p. Members, $20.; nonmembers, $24.

Following the normalization of relations between China and the U.S., it was agreed that the Chinese Society of Aeronautics and Astronautics and the American Institute of Aeronautics and Astronautics would undertake an exchange of scientists and engineers to initiate the process of technical communication between the two nations in the field of aeronautics. This book reports the observations of the AIAA delegation which visited various aeronautical facilities in China. The history of Chinese aeronautics is considered along with aspects of aircraft production, engine production, and aerodynamics research, development, and testing. Attention is given to materials and structures, flight testing, guidance and control, computers, university educational programs, special topics, and aspects of travelling in China. G.R.

A82-13237 **The Agusta A129.** B. Lovera (Costruzioni Aeronautiche Giovanni Agusta S.p.A., Gallarate, Italy). *Vertiflite,* vol. 26, Nov.-Dec. 1980, p. 6-9.

The design characteristics, performance capabilities and electronics systems of the A-129 light combat helicopter currently under development for Italian Army use are discussed. Attention is given to the aircraft's Integrated Multiplex System (IMS), whose functions fall into four categories: (1) the optimized interconnection of radios and navigation equipment; (2) the management of electrical power distribution, powerplant monitoring and control, and caution and warning; (3) the integration of motion sensors, digital stability augmentation systems, and flight director function; and (4) the operation of cockpit control and display elements, including flight management and radio control. The twin-turboshaft helicopter is primarily armed for the antitank role, with the TOW missile system mounted on stub wing pylons. Attention is also given to the airframe, mission equipment, and configuration flexibility of the aircraft. O.C.

A82-13238 **Public service helicopters - Is the grass greener on the other side of the fence.** T. R. Stuelpnagel. *Vertiflite,* vol. 26, Nov.-Dec. 1980, p. 10-13.

The impact on helicopter design of public service helicopter users, concerned with such tasks as law enforcement and public safety, search and rescue, wildlife and land management, fire fighting, medical services and disaster relief, is assessed in view of the present and growth markets they represent. New public service helicopter sales are estimated to be 5-10% of total commercial sales. It is recommended that public service helicopter users review their experience with each helicopter type employed and make their evaluations and requirements known to both the government and helicopter manufacturers on an annual basis. An awareness of helicopter equipment and configuration development would also be helpful, in order to propose the incorporation of features relevant to public service missions during the design phase of new helicopters, whose development cost is now on the order of $10,000 per pound of gross weight. O.C.

A82-13239 **The TADS/PNVS 'eyes' for the AH-64 attack helicopter.** B. J. Baskett, C. M. Tsoubanos, and V. M. Weiner (U.S. Army, Aviation Research and Development Command, St. Louis, MO). *Vertiflite,* vol. 26, Nov.-Dec. 1980, p. 14-17.

The Target Acquisition Designation Sight (TADS)/Pilot Night Vision Sensor (PNVS) electrooptical subsystem of the AH-64 advanced attack helicopter is described, with attention to its Integrated Helmet and Display Sight System (IHADSS). The TADS provides the helicopter copilot/gunner with day, night, and adverse weather target search, detection and recognition capabilities by means of (1) direct view optics (DVO), (2) day television (DTV), and (3) forward looking infrared (FLIR) sighting subsystems, each subsystem being used singly or in combination depending on tactical, weather, or visibility conditions. The TADS also provides a laser designator to illuminate the target and guide HELLFIRE missiles, and a laser receiver which provides target range measurements for fire control computations. Samples of typical PNVS symbology, including heading, power management, airspeed, and radar altitude, are also given. O.C.

A82-13240 **Fatigue methodology - A technical management system for helicopter safety and durability.** L. L. Douglas. *Vertiflite,* vol. 27, Mar.-Apr. 1981, p. 14-17.

An account is given of the development since the early 19th century, of the technical disciplines comprising the field of fatigue-related structural safety as it applies to the design and maintenance of helicopters. Attention is given such milestones in the development of analytical methods for rotating machinery and vibration and flutter problems as N.O. Myklestad's (1944) 'A New Method of Calculating Natural Modes of Uncoupled Bending Vibration of Wings and other Types of Beams', as well as the related topics of the fatigue strength of materials and its improvement by surface treatment, stress concentration, cumulative damage and fatigue crack propagation. A review is also made of more recent developments in the design of fail-safe structures, the production of fracture-tough steel, aluminum and titanium alloys, and the application of composite materials to helicopter rotor blades. O.C.

A82-13241 **Heavy lift helicopters - A national technology opportunity.** G. H. Fries (Boeing Vertol Co., Philadelphia, PA). *Vertiflite,* vol. 27, May-June 1981, p. 14-17.

The mission requirements and possible design features of future heavy lift helicopters (HLH) in the 120,000 to 150,000-lb gross weight category are described. Attention is given to the military need for such helicopters in view of the U.S. Army's cancellation of the XCH-62 HLH project and the Soviet Union's reported development of the NATO code-named 'Halo' HLH, which has a lift capacity greater than that of any U.S. cargo helicopter. Consideration is given to the relative advantages of the military, 'crane' configuration and those of a full-fuselage transport design with lower aerodynamic drag and greater productivity in longer-range missions. The transport fuselage configuration is also suited for short-haul commercial passenger service, with 140-150 seats initially and 225 seats in subsequent growth versions. Development-program cooperation between the Department of Defense and NASA is recommended. O.C.

A82-13242 **The FAA's proposed helicopter certification rules.** R. G. Schlegel (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). *Vertiflite*, vol. 27, May-June 1981, p. 18-21.

A response is presented by the helicopter manufacturing industry to the FAA's Notice of Proposed Rule Making NPRM 79-13, 'Noise Standards for Helicopters in the Normal, Transport, and Restricted Categories'. Among the grounds cited for rejection are: (1) the proposed regulation sets limits that are too low, and incompatible with, the capabilities of existing technology for predicting and controlling helicopter noise; (2) regulation is premature at this time, because uncertainty as to the actual noise of the helicopters affected prevents a complete analysis of the regulation's economic impact; and (3) a loss of $8 billion in sales of current helicopter models could result from implementation of NPRM 79-13, with an additional $4.8 billion sales loss due to delays in the introduction of new helicopter designs. A joint industry/government program to establish the noise levels of all helicopters affected by the regulation is recommended. O.C.

A82-13243 **Helicopter icing.** A. A. Peterson and L. U. Dadone (Boeing Vertol Co., Philadelphia, PA). *Vertiflite*, vol. 27, May-June 1981, p. 22-25.

Due to the increased Instrument Flight Rules (IFR) capabilities of modern helicopters and the associated need for all-weather clearance, the U.S. Department and Defense and FAA are emphasizing helicopter icing investigations. Of all existing helicopters, only the Bell 412 is undergoing icing certification tests, and the SA 330 PUMA alone has obtained unlimited clearance for flight in forecast icing conditions. Consideration is given to the simulation of natural icing conditions by means of (1) icing wind tunnels; (2) environmental cold chambers; (3) helicopter tie-down sites that employ natural icing; (4) hover spray rigs; and (5) in-flight spray systems. Attention is also given to rotor ice protection systems, including those that employ high-resistance electrical heating elements, inflatable boots, microwave energy, controlled vibration, and such chemical freezing point depressants as glycol. O.C.

A82-13244 **Light Airborne Multi-Purpose System.** J. M. Purtell (U.S. Navy, Washington, DC). *Vertiflite*, vol. 27, Sept.-Oct. 1981, p. 10-13.

The Light Airborne Multi-Purpose System (LAMPS) MK III is the U.S. Navy's first fully integrated ship/air weapons system, combining frigates, destroyers and cruisers as platforms with Seahawk missile-carrying helicopters for the basic ASW mission. The helicopters also provide targeting data for Harpoon surface-to-surface missiles. The LAMPS ship/air system, which will involve over 100 ships and 204 aircraft over the next 25 years, will overcome four traditional weaknesses: (1) radar horizon limits, (2) sonar discrimination limits at extended ranges, (3) the range limitations of ASW weapons, and (4) limited missile-targeting ranges. Other elements comprised by the system are secure and open HF and UHF voice channels system management and control signal processors for the analysis of tactical data, and helicopter-delivered MK-46 ASW torpedoes. O.C.

A82-13245 **Helicopter IFR - Past, present and future and future.** V. E. Albert (Petroleum Helicopters, Inc., New Orleans, LA). *Vertiflite*, vol. 27, Sept.-Oct. 1981, p. 18-20.

An account is given of the developmental history and future prospects of helicopter Instrument Flight Rules (IFR) regulatory policies, flight instruments and procedures. The development of helicopter IFR has been speeded by British North Sea offshore oil drilling operations, whose helicopter service regularly encounters severe flying conditions. Among the problems encountered in the establishment of helicopter IFR in the U.S. have been the development of route structures to support such flights in the Northeast Corridor and Gulf Coast regions, the complexity of telephone and radio relay communications with air traffic controllers, and the establishment of weather stations. At present, in addition to the installation of offshore VHF radio stations in the Gulf of Mexico, a weather observation network and a route structure have been provided. The Loran Flight Following Program being tested at Houston station will provide remote areas with traffic separation services currently available only in urban areas, while costing only as much as two VHF remote radio locations. O.C.

A82-13246 **Wire strike protection.** C. Silvious (Tennessee Valley Authority, Knoxville, TN). *Vertiflite*, vol. 27, Nov.-Dec. 1981, p. 16-19.

Consideration is given to the design requirements of, and experience to date with, helicopter wire-strike protection devices made necessary by low-altitude operations in areas with extensive electrical transmission and communication lines. The tensile strengths of electrical transmission wires varies between 5000 and 233,000 lb, averaging 27,000 lb, and may become entangled in rotating parts even if successfully broken or cut by a helicopter. In addition to the education of pilots to better recognize wire strike hazards, attention is given to the use of wire-marking devices, which are useful in daytime operations, and the design of tail-rotor, main rotor and fuselage devices for cutting through or shielding against wires. It is recommended that all three measures be taken in future strike-reduction efforts by utilities and other helicopter operators. O.C.

A82-13314 **Costs of noise nuisance from aircraft.** P. W. Abelson (McQuarie University, North Ryde, New South Wales, Australia). *International Journal of Environmental Studies*, vol. 17, no. 3-4, 1981, p. 225-232. 10 refs.

The paper summarizes the results of research into aircraft noise costs around Sydney airport. The NEF (noise exposure forecast) model of noise annoyance is shown to provide a fair index of average, but not individual, attitudes toward noise. Although property prices were found to fall only by an average of 0.4% NEF, the fall per NEF is greater for higher values of NEF and for higher income households. However, household turnover rates due to noise, and therefore the costs of moving house, were found to be higher than those predicted by the Roskill Commission for the expected third London airport. Also, householders in noisy areas experience substantial losses in householder surplus, due in part to imperfect expectations of the noise effects. (Author)

A82-13451 **Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers.** Conference sponsored by the American Institute of Aeronautics and Astronautics and Institute of Electrical and Electronics Engineers. New York, American Institute of Aeronautics and Astronautics, 1981. 645 p. Members, $65.; nonmembers, $75.

Digital avionics are discussed in terms of a system integration concept, fault isolation methodology, system effectiveness, advanced designs, sneak software analysis, and the pilot's role in an automated flight deck. Specific applications for the L-1011 flight control system, for hardware/software integration on the Shuttle, for one man operation of the F/A-18 Hornet, with voice command control, and for advanced weapons systems were considered. Papers were also presented on individual components of digital avionics systems such as the MIL-STD-1750 chip set, standardization and semiconductors, fiber optics, connectors for data buses, large screen CRT touch panels, an electronic terrain map, and flat panels for future military aircraft. D.H.K.

A82-13452 # **Integrated avionics - Concepts and concerns.** D. G. Botha (USAF, Avionics Laboratory, Wright-Patterson AFB, OH). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 1-9. 14 refs. (AIAA 81-2211)

It is noted that the capability of avionics technology continues to increase by an order of magnitude every few years, but overall avionic system design architecture lags in the ability to fully exploit new technology and knowledge, particularly in the partitioning of the avionics-as-a-whole into subsystems for implementation by engineers in many disciplines, and in the integration of subsystems into the whole. In this paper, it is suggested that a concerted effort is needed by the avionics community to reexamine system partitioning, considering the relationship of subsystems in the light of new operational concepts, new knowledge in information and control theory, and different concepts of integration such as multisensor information fusion and integrated control and display interface with the crew. B.J.

A82-13453 # **F/A-18A weapon system - 1976 state of the art.** R. C. Drummond (McDonnell Aircraft Co., St. Louis, MO). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers.
New York, American Institute of Aeronautics and Astronautics, 1981, p. 10-20. (AIAA 81-2215)

The F/A-18A system will perform both air/air and air/surface missions and has been designed for low operating and support costs through excellent reliability and maintainability. Advanced technologies include a one-man operable cockpit, using multifunction programmable CRTs and an automated hands-on-throttle-and-stick concept. Also included are a highly flexible radar using advanced digital processing and memory techniques, a programmable stores management set with multiplexed store stations, a quad-redundant electronic flight control system, and an expanded built-in-test capability. The design and performance features of the F/A-18A system are examined, and the future outlook is discussed. B.J.

A82-13455 # **Digital avionics - What a pilot expects to see.** R. A. Berube (Pan American World Airways, Inc., Miami, FL). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers.
New York, American Institute of Aeronautics and Astronautics, 1981, p. 28-38. 57 refs. (AIAA 81-2217)

The application of digital computers to aircraft is discussed from the pilot's point of view. Consideration is given to future digital design, human factors, cockpit instrumentation and predictive information, replication of the visual scene, display types, and performance/flight management systems. Particular attention is given to the importance of cockpit displayed traffic information. B.J.

A82-13456 # **Applications of digital avionics to commercial transport aircraft - The DC-9 Super 80 and beyond.** J. H. Shannon and J. D. McDonnell (Douglas Aircraft Co., Long Beach, CA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers.
New York, American Institute of Aeronautics and Astronautics, 1981, p. 39-46. (AIAA 81-2218)

The airlines' decade of experience with digital airborne equipment is reviewed, and some of the benefits arising from active controls, advanced cockpits, and advanced ATC systems that will be incorporated in the 1980's are described. This experience has given the airlines and manufacturers the confidence to further implement avionics systems with digital technology. The DC-9 Super 80 is now in revenue service with a digital flight guidance system, and other aircraft will soon enter service with the new ARINC 700 line of equipment. Additional benefits will be gained in the second half of the 1980's owing to both the cost-effective character of the equipment itself and the increase in efficiency of airframes and propulsion systems that can be obtained through further application of the digital equipment. B.J.

A82-13457 # **The role of avionics in the all electric airplane.** M. J. Cronin (Lockheed-California Co., Burbank, CA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 47-55. 22 refs. (AIAA 81-2219)

The paper examines the role of avionics in the development of the all-electric airplane (AEP) as a viable and energy-efficient transport. It is noted that avionics will play a key role in the fuel and thrust management of the advanced-technology engines of the AEP via technology such as FADEC (full authority digital engine control). Attention is also given to the important role of avionics in the flight control of future AEPs, operating with a relaxed static stability and advanced supercritical wings. The samarium-cobalt motor/generator development and the proliferating use of power electronics for engine starting/motor control are also discussed. B.J.

A82-13458 # **Fault isolation methodology for the L-1011 digital avionic flight control system.** W. B. Noble (Rockwell International Corp., Collins Air Transport Div., Van Nuys, CA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers.
New York, American Institute of Aeronautics and Astronautics, 1981, p. 56-61. (AIAA 81-2223)

The operation of and rationale for the fault isolation/data display system for the L-1011 digital avionic flight control system are described. These systems are currently in service and are, despite the usual and expected introductory problems, providing substantial maintenance benefit. The English-language format chosen for the display as well as the storing of the squawk (or event) which accompanied each fault, have been instrumental in reducing maintenance confusion and false LRU removals. Present status mode is being used to solve a number of intricate maintenance problems in minutes, which previously required hours of troubleshooting time. B.J.

A82-13463 # **Avionics implications from weapon system operational utility studies on Manned Air Combat Simulators.** N. J. Kessler and H. Passmore (McDonnell Aircraft Co., St. Louis, MO). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 85-92. (AIAA 81-2230)

The McDonnell Aircraft Company Manned Air Combat Simulator (MACS) is described. The simulator facility is discussed, and a definition of the test models is given. In addition, attention is given to the lessons learned and system modifications which evolved as a result of this type of testing. It is noted that the value of MACS has recently been demonstrated as a tool for the evaluation in a simulated combat environment of the operational utility of such systems as the Advanced Medium Range Air-to-Air Missile (AMRAAM). B.J.

A82-13465 # **Computer-in-control selection logic for a triplex digital flight control system.** F. J. Farrell (Boeing Military Airplane Co., Seattle, WA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 97-101. (AIAA 81-2236)

The computer-in-control logic (CICL) unit is an independent monitor that ensures proper selection of one of two flight control computers to the simplex level with minimum switching. The CICL maximizes fault tolerance without being a source of a single-point failure; its implementation is simple and reliable, and its algorithm is easy to change. This paper presents a functional description of the CICL and examines potential architectural considerations. B.J.

A82-13466 * # **Application of the concept of dynamic trim control and nonlinear system inverses to automatic control of a vertical attitude takeoff and landing aircraft.** G. A. Smith and G. Meyer (NASA, Ames Research Center, Moffett Field, CA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers.
New York, American Institute of Aeronautics and Astronautics, 1981, p. 102-115. 8 refs. (AIAA 81-2238)

A full envelope automatic flight control system based on nonlinear inverse systems concepts has been applied to a vertical attitude takeoff and landing (VATOL) fighter aircraft. A new method for using an airborne digital aircraft model to perform the inversion of a nonlinear aircraft model is presented together with the results of a simulation study of the nonlinear inverse system concept for the vertical-attitude hover mode. The system response to maneuver commands in the vertical attitude was found to be excellent; and recovery from large initial offsets and large disturbances was found to be very satisfactory. B.J.

A82-13467 # **Aircraft separation assurance avionics.** R. Sobocinski (Bell Aerospace Textron, Belmont, CA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 116-118. (AIAA 81-2239)

Avionics sensors are under development to detect other transponder equipped aircraft. These sensors are subsets of systems postulated for the next generation aircraft. An Active BCAS system sponsored by the FAA interrogates, tracks and provides vertical collision avoidance commands. A Cockpit Display of Traffic Information (CDTI) sensor under NASA sponsorship passively detects transponder replies to ground based SSR sites. The CDTI provides a horizontal situation traffic display. This unit is being evaluated for pilot human factors interface. (Author)

A82-13468 # **Aircraft alerting systems standardization study.** G. P. Boucek, Jr., D. C. Hanson (Boeing Commercial Airplane Co., Seattle, WA), D. A. Po-Chedley (Douglas Aircraft Co., Long Beach, CA), B. L. Berson, M. F. Leffler (Lockheed-California Co., Burbank, CA), and J. F. Hendrickson (FAA, Washington, DC). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 119-128. 10 refs. FAA-supported research. (AIAA 81-2242)

The objectives of the Aircraft Alerting Systems Standardization Study were to augment the existing alerting system data base, to develop candidate alerting system concepts, to implement and validate these concepts, and to develop a set of alerting system guidelines and recommendations to standardize alerts on future electronic flight decks. This paper examines some of the more salient of these system guidelines and recommendations, which include: (1) that a functionally standardized alerting system be used on all future transport aircraft regardless of manufacturer, aircraft type, or airline operator; (2) that pilots audio/visual environment be improved by minimizing exposure to unnecessary or confusing alerts; (3) that three distinctively coded alert categories be provided to reduce uncertainty; and (4) that use be made of both visual and auditory channels to increase system effectiveness. B.J.

A82-13470 # **Design and analysis of a digitally controlled integrated flight/fire control system.** J. H. Blakelock (Applications Research Corp., Dayton, OH). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 135-143. 7 refs. Contract No. F33615-78-C-3145. (AIAA 81-2245)

An integrated flight/fire control system including a movable gun and gimbaled line-of-sight tracker was designed using root locus techniques for the inner analog control loops and discrete analysis of the sampled-data outer control loops. The control systems designed include a pitch orientational control system with an outer attitude control loop, a beta/first time derivative of beta lateral stability augmentation system (where beta is the sideslip angle) with command yaw rate and a roll angle control system with an outer yaw attitude control loop, a velocity control system, a control loop for the movable gun, and the tracking control system. The discrete analysis was performed in the z-plane using traditional methods and in the s-plane using the Padé approximation. The gains for neutral stability and corresponding system natural frequencies predicted by both analysis techniques showed excellent correlation with the value obtained from a detailed six-degree-of-freedom hybrid simulation of the aircraft and various control systems. B.J.

A82-13471 # **Joint Tactical Microwave Landing System /JTMLS/ airborne signal processing.** R. J. Kelly and J. T. Skudrna (Bendix Corp., Communications Div., Baltimore, MD). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 144-155. 7 refs. (AIAA 81-2247)

The Joint Tactical Microwave Landing System, a lightweight transportable landing system which will provide all-weather precision approach guidance to drop zones, landing zones, and runways for MLS-equipped CTOL, STOL, VTOL, and rotary wing aircraft, is described with emphasis on the airborne avionics. It is shown how the airborne angle receiver satisfies the operational requirements by using an integrated digital avionics design and associated airframe antennas. This integrated avionics system will detect the MLS signal over a wide range of aircraft attitudes and will provide signal processing to generate lateral, vertical, and longitudinal guidance information for the complete spectrum of military FCS and cockpit displays. V.L.

A82-13472 # **LHX - An advanced avionics system design.** D. S. D'Avino (SEMCOR, Inc., Neptune, NJ) and S. S. Spiegel (SEMCOR, Inc., Moorestown, NJ). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 156-162. (AIAA 81-2249)

The paper reports results of a study which was performed with the objective of developing an avionics system concept for the LHX, an advanced Army weapons system. The preliminary results indicate that all currently defined LHX requirements for the armed scout mission are achievable using advanced technology and innovative system integration techniques. It is also shown that a one-man crew for the LHX is technically feasible. V.L.

A82-13481 * # **Have we overlooked the pilot's role in an automated flight deck.** G. G. Steinmetz, L. H. Person, and S. A. Morello (NASA, Langley Research Center, Hampton, VA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 222-227. 22 refs. (AIAA 81-2262)

Having adopted a philosophy of presenting situation information rather than command type as evidenced in flight directors and of keeping the pilot in a decision-making role, a series of simulation and flight experiments has occurred over a number of years as part of the Langley Terminal Configured Vehicle program. This paper traces the development, refinement, and integration of electronic pictorial displays, and a computer augmented velocity vector control mode. Some benefits and performances derived within the basic philosophy and information usage are brought forth in the discussion as results from the various simulator and flight evaluations are presented. (Author)

A82-13482 # **The application of large screen CRT's, touch panels, and voice to the flight stations of the 1990's.** R. L. Wasson and H. S. Archer, III (Lockheed-Georgia Co., Marietta, GA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 228-236. 5 refs. (AIAA 81-2263)

The paper examines how advances in technology, such as large screen displays, touch panels, and voice control affect the design of Lockheed's 1990's flight station. An integrated design embodying these concepts is presented and the advantages of such a design is explored. The paper is divided into two sections, the first addresses the inclusion of the advanced technology in the overall design of the flight station, and specific large screen display formatting, the second discusses the display/control technology necessary to implement such a design. (Author)

A82-13483 # **Electronic flight deck displays for transport aircraft.** R. A. Chorley (Smiths Industries Aerospace and Defence Systems Co., Cheltenham, Glos., England). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 237-246. 5 refs. Research supported by the Department of Industry and Ministry of Defence (Procurement Executive). (AIAA 81-2264)

Electronic flight deck and systems information displays for transport aircraft are discussed. Operational and economic advantages for military and civilian aircraft are reviewed, such as the flexibility of the display format which enables all information required for control of a transport aircraft to be displayed on the main panel, and the flexibility of the electronic system which minimizes the effects of failure within the display system. The display system configuration and the units of the electronic display system are presented, and human factors are considered. D.L.G.

A82-13484 # **F/A-18 'Hornet' - One man operability.** E. C. Adam (McDonnell Aircraft Co., St. Louis, MO). In: Digital Avionics

Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 247-251. (AIAA 81-2266)

Features of the F/A-18 fighter avionics design which allow one man operation in both fighter and attack modes are described. A CRT, along with head-up displays, provide the pilot with information essential for air-to-air, air-to-surface, and navigation modes. Pilot scan times are reduced because of information grouping and mission reliability is enhanced because of redundant image projection capabilities. The hands on throttle and stick system has an automated LOCK light for weapons delivery in a completely head-up, sensor-aided gun or missile attack. Console activity has been minimized through automation of time critical tasks, thus reducing the chances for pilot error or vertigo. A 98% failure detection and 99% failure isolation is built into the weapon system maintenance monitor panel. Operational capability is scheduled for 1983. M.S.K.

A82-13486 # **ARINC 429 digital data communications on the Boeing 757 and 767 commercial airliners.** R. K. Chun (Boeing Aerospace Co., Seattle, WA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 252-256. 5 refs. (AIAA 81-2267)

This paper will address the development and applications of the ARINC 429 digital data bus on the new generation of Boeing 757 and 767 commercial aircraft. The ARINC 429 Digital Information Transfer System (DITS) broadly defines a new digital data transmission format for avionics subsystems used in the next generation of commercial aircraft avionics applications. Boeing's development of a transmitter and receiver hybrid circuit which is compatible with ARINC 429 at the data bus interface will also be discussed. The hybrid package is hermetically sealed and designed to comply with the full range of military temperature requirements. (Author)

A82-13487 # **A polled contention multiplex system using MIL-STD-1553 protocol.** D. H. Wilson (Vought Corp., Dallas, TX). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 264-270. (AIAA 81-2271)

The polled contention mode in the Avionic Multiplex System is discussed, and a technique to pass the bus controller function between the terminals based on the activity of input data is presented. Improvements such as decreased data latency, more efficient bus utilization, and simplicity in software implementation are reviewed, and associated problems are considered. It is concluded that the use of dynamic bus allocation will have increasing significance as future systems become larger and more complex, while the polled contention mode may be a viable alternative to the command response system. D.L.G.

A82-13488 # **Avionics systems simulation for the Northrop F/A-18L aircraft.** R. A. Weeks (Northrop Corp., Hawthorne, CA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 271-278. (AIAA 81-2274)

A real-time, man-in-the-loop avionics systems simulation for the Northrop F/A-18L aircraft is discussed. Objectives include developing, implementing, and verifying the integration of the F/A-18L avionics systems with the human pilot. A fixed-based visual flight simulator with a high fidelity cockpit environment is used to assess pilot/system performance when subjected to multiple aircraft engagements, which provides operational characteristic simulations of the aircraft's radar, head-up display, integrated stores management, mission computer, and navigation systems. Consideration of the human pilot with the electronic systems allows early evaluations of potential problem areas, resulting in significant changes in the avionics systems. D.L.G.

A82-13490 * # **The SIFT computer and its development.** J. Goldberg (SRI International, Menlo Park, CA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 285-289. 8 refs. Contract No. NAS1-15428. (AIAA 81-2278)

Software Implemented Fault Tolerance (SIFT) is an aircraft control computer designed to allow failure probability of less than 10 to the -10th/hour. The system is based on advanced fault-tolerance computing and validation methodology. Since confirmation of reliability by observation is essentially impossible, system reliability is estimated by a Markov model. A mathematical proof is used to justify the validity of the Markov model. System design is represented by a hierarchy of abstract models, and the design proof comprises mathematical proofs that each model is, in fact, an elaboration of the next more abstract model. S.C.S.

A82-13498 # **The electronic terrain map - A new avionics integrator.** D. M. Small (USAF, Avionics Laboratory, Wright-Patterson AFB, OH). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 356-359. (AIAA 81-2289)

The map reading process is a demanding task which can be simplified by using a digital map subsystem which accesses the information needed and presents it in a form which can be easily interpreted. An electronic map subsystem can generate perspective scenes, which are essentially computer generated images of the surrounding area, and an electronic map should be much easier to interpret. In addition, essential information from the map data base can be placed on the pilots Head Up Display, reducing the need for head down operations. Work on an all electronic map for aircraft display applications was started in 1976. The design and fabrication of an Airborne Electronic Terrain Map System (AETMS) was begun in May 1980. Requirements concerning future avionics systems are examined, and a future aircraft system is discussed. Attention is given to terrain following/terrain avoidance, threat avoidance, and navigation. G.R.

A82-13499 # **The interface of multifunction controls and displays to tomorrow's avionics.** W. G. Mulley (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 360-364. (AIAA 81-2290)

Approaches for keeping the cost of avionics systems at a lower level are considered, taking into account the use of systems which are easy to develop, produce, operate, and maintain. The solution of a maintenance problem includes operations related to recognizing a malfunction, isolating a malfunction, correcting a malfunction, verifying the correction, and documenting the maintenance action. The cockpit can be considered a computer terminal station, and it can become the maintenance shop for all the hardware in the particular aircraft. Five hardware interfaces and one software interface can completely define all hardware and software modules for the entire display and control subsystem. G.R.

A82-13500 # **An update of an integrated CNI system - TIES.** L. E. Smith and G. B. Heal (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 365-371. 9 refs. (AIAA 81-2292)

The Tactical Information Exchange System, TIES, is an integrated approach to providing the Communication, Navigation, and Identification (CNI) suite for future Naval aircraft. The system is based upon identifying the functional elements of a CNI suite and assembling them in a fashion that provides greater system reliability and availability over those currently available. TIES demonstration hardware is discussed, and the frequency conversion subsystem is considered, taking into account the HF site, the VHF/UHF site, and the Lx band site. Attention is given to the frequency division multiplex subsystem, the signal conversion subsystem, the TIES control subsystem, the data management and distribution assembly, the TIES external test, and questions regarding the further development of the TIES system. G.R.

A82-13502 # **The use of separated multifunction inertial sensors for flight control.** W. J. Luedde (McDonnell Aircraft Co., St. Louis, MO). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 377-382. (AIAA 81-2295)

The Multifunction Flight Control Reference System (MFCRS) program has the objective to verify that the outputs of inertial grade ring laser gyros and high quality accelerometers in a 'strapdown' configuration can be processed by a digital computer and used as the flight control feedback reference in a modern fighter, the F-15. To achieve these goals, a control law development study was performed to evaluate the effects of sensor location on flight control stability and performance. In addition, a redundance management algorithm, which uses parity equations, was developed to satisfy sensor selection and fault detection and isolation requirements. The MFCRS simulation model is considered, taking into account the F-15 flight control system, F-15 airframe dynamics, and an MFCRS sensor model. Attention is also given to sensor location studies, moment arm compensation studies, and aspects of simulator evaluation. G.R.

A82-13503 # **Redundancy management of skewed and dispersed inertial sensors.** D. L. Sebring (McDonnell Aircraft Co., St. Louis, MO) and J. T. Young (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 383-391. 13 refs. (AIAA 81-2296)

A redundancy management approach has been developed for strapped-down inertial instruments used as flight control reference sensors. The sensors will be installed and flight tested in a high-performance fighter aircraft (F-15) in a configuration consisting of two skewed and dispersed sensor clusters. Each cluster is an orthogonal triad of co-located, inertial-quality ring-laser gyros, and accelerometers. Two sets of logic (sensor selection and fault detection and isolation) operate in parallel, obtaining sensor selection and failure status information from stored tables. Table pointers are generated by comparing the values of parity equations to variable trip levels. An off-line, analytic computer program is used to generate the stored tables. This approach has been verified using Monte Carlo and F-15 Continuous System Modeling Program (CSMP) simulations. (Author)

A82-13504 # **Development and laboratory test of an integrated sensory system /ISS/ for advanced aircraft.** W. K. Toolan and A. M. Zislin (Grumman Aerospace Corp., Bethpage, NY). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 392-399. 8 refs. Contract No. N62269-79-C-0206. (AIAA 81-2297)

This paper presents the results of the second phase of an Integrated Sensory Subsystem (ISS) development effort performed by Grumman under contract to the Naval Air Development Center. The ISS is a combination of redundant inertial sensors, air data probes, transducers, and other flight control related sensors, interfaces, and the associated Data Handling System (DHS). The sensor data derived within the ISS meets the requirements (i.e., performance, redundancy, survivability, etc.) for Digital Fly-By-Wire (DFBW) flight control systems. The key issue of this development phase was the synthesis and development of a DHS for dispersed arrays of flight control inertial sensors subjected to dissimilar motions due to body bending of the aircraft structure. The system design is described in terms of the hardware and Data Handling System synthesis, followed by a discussion of the methods utilized to verify system performance. (Author)

A82-13505 # **Direct digital drive actuation.** L. L. Kohnhorst (Rockwell International Corp., Columbus, OH). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 400-408. (AIAA 81-2298)

The Digital Flight Control System (DFCS) exploits the advantages of fly-by-wire mechanizations and digital technology while maintaining the demonstrated safety and reliability of manual control systems. However, the use of the DFCS would increase aircraft life cycle costs and decrease operational readiness if conventional avionic hardware configuration methods are applied to new aircraft designs. One of the programs initiated by the Navy with the objective to simplify the complexity of DFCS is related to the development of the Advanced Flight Control Actuation System (AFCAS). The AFCAS is to make use of a simplified, modular, fly-by-wire actuator. The simplified actuation can be accomplished without loss in mission reliability, but with improved mean time between failure (MTBF) because of the reduced complexity. The computer interface complexity is simultaneously reduced because of circuit requirements that are more compatible with digital technology than present day analog circuits. G.R.

A82-13506 # **Applications of head-up displays in commercial transport aircraft.** J. R. Lowe and J. R. Ornelas (Douglas Aircraft Co., Long Beach, CA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 409-414. 6 refs. (AIAA 81-2300)

The demanding tasks which the commercial transport pilot encounters during approach and landing are made easier by a suitable Head-Up Display (HUD) design. The HUD simplifies for the pilot tasks of decision-making, control and management. It also relieves him of the need to take his eyes from the view ahead to refer to his panel instruments. During an instrument approach, all guidance cues are available head-up whether or not any ground cues are visible. The continuously advancing state-of-the-art has improved the HUD with a larger field of view, more distinct images, and more easily followed symbology. These improvements have been made possible by advancements in HUD optic design, the use of the cathode-ray tube, the digital computer, and more sophisticated control laws. The first commercial transport HUD system in general use, now certified for the DC-9 Super 80, benefits from these improvements. G.R.

A82-13507 # **Flat panel developments for future military aircraft.** J. Brindle and W. G. Mulley (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 415-423. (AIAA 81-2302)

The four basic types of information for application in military aircraft are related to imaging or video, graphic, message, and discrete data. Various cockpit-mounted units are considered, taking into account the Head-Up Display, the Helmet-Mounted Display, the Mission Management Display and the Multifunction Programmable Keyboard. The display media employed include thin film electroluminescent devices, the light emitting diode, and the liquid crystal. Display addressing is discussed, giving attention to thin film transistor arrays, the integral silicon drive, the crossed electrode matrix, and the varistor. Plans for establishing technical requirements for each of the display system areas are also described. G.R.

A82-13508 * # **An integrated control panel utilizing a programmable varistor-multiplexed dichroic liquid crystal display.** I. J. Whitton (General Electric Co., Aircraft Equipment Div., Utica, NY). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 424-427. Contract No. NAS1-16414. (AIAA 81-2303)

Due to the conflicting demands of modern aircraft for increased systems/sensors and the decrease in cockpit panel size, weight, volume, and power, conventional discrete/dedicated methods of display and control are fast becoming obsolete. A means is sought to integrate the control and display into multifunctional programmable devices, thus giving the ability to increase system functions and yet conserve panel space. A potential solution to the control portion of the problem has come to be known as the Integrated Control Panel (ICP) approach. Flat panel display technology and controls using programmable flat panel displays with transparent capacitive touch control overlays offer the largest potential advantages. The flat panel display made of varistor-multiplexed dichroic liquid crystal (LCD) developed by GE in recent years appears to offer the ideal monochrome solution. (Author)

A82-13513 # **Digital avionics display processor.** E. G. Hamiltun, Jr. and S. H. Petrofsky (Emerson Electric Co., St. Louis, MO). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Instituta of Aeronautics and Astronautics, 1981, p. 466-472. (AIAA 81-2311)

This paper addresses the processing and display of the ever increasing amount of data from the new and sophisticated sensors currently being planned for aircraft use. Emphasis is placed on a display processor architecture designed for a multisensor environment. Detailed architecture description and some specific display and signal processing examples are included to illustrate data flow within this architecture. (Author)

A82-13514 # **Advanced display systems for crew stations of tactical aircraft.** W. G. Ast and D. E. Green (Loral Corp., Loral Electronics Systems Div., Atlanta, GA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 473-481. (AIAA 81-2312)

This paper describes the architecture and system characteristics of a family of intelligent operator/machine controlled Advanced Display Systems for use in modern tactical aircraft. A distributed processing communications link facilitates this type of a self contained control/display subsystem by minimizing demand on the central mission computer and providing flexibility in crew and cockpit display/control requirements. The major items of the Advanced Display System, including the Interactive Processing Terminal, the Universal Display Generator and the displays, are described in light of their features, capabilities and applications. The system is discussed from the standpoint of data load, timing constraints, display quality, dynamic performance and human factors. (Author)

A82-13515 # **Computergraphics for aircraft control.** S. F. Filarsky and W. G. Mulley (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 482-485. (AIAA 81-2313)

The Command Flight Path Display (CFPD) has been developed to demonstrate the feasibility of providing attitude, altitude, direction and speed command to the pilot in the form of an electronically generated presentation of the real world flight path which should be flown. The principal objective of the CFPD is to assure the precise and effective guidance and control of piloted aircraft at all times. The display system achieves this goal by computing the desired, or 'command' flight path and the deviations of the aircraft from that path, and then presenting a graphical representation of this combined 'director' and 'orientation' information to the pilot. Complete information on the attitude, altitude, speed and direction of the aircraft is presented continuously by the CFPD, whether the aircraft is under manual or automatic flight control. Therefore, the pilot is able to control all of the vehicle's six degrees of freedom by reference to the single, integrated display. The flight path display concept may be applicable to all phases of flight eventually, but the present developmental effort is confined to earth-referenced applications. Accordingly, the feasibility demonstration was limited to three such applications: takeoff, landing and fixed-target, air-to-ground attack. (Author)

A82-13516 * # **An advanced programmable/reconfigurable color graphics display system for crew station technology research.** R. J. Montoya (Research Triangle Institute, Research Triangle Park, NC), J. N. England (IKONAS Graphics Systems, Inc., Raleigh, NC), J. J. Hatfield (NASA, Langley Research Center, Hampton, VA), and S. A. Rajala (North Carolina State University, Raleigh, NC). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 486-498. 6 refs. (AIAA 81-2314)

The hardware configuration, software organization, and applications software for the NASA IKONAS color graphics display system are described. The systems were created at the Langley Research Center Display Device Laboratory to develop, evaluate, and demonstrate advanced generic concepts, technology, and systems integration techniques for electronic crew station systems of future civil aircraft. A minicomputer with 64K core memory acts as a host for a raster scan graphics display generator. The architectures of the hardware system and the graphics display system are provided. The applications software features a FORTRAN-based model of an aircraft, a display system, and the utility program for real-time communications. The model accepts inputs from a two-dimensional joystick and outputs a set of aircraft states. Ongoing and planned work for image segmentation/generation, specialized graphics procedures, and higher level language user interface are discussed. M.S.K.

A82-13517 # **Higher order Information Transfer Systems are coming.** J. W. McCuen (Hughes Aircraft Co., Fullerton, CA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 499-506. 11 refs. (AIAA 81-2317)

The functions necessary for airframe/weapons system integration in advanced avionics systems are reviewed, noting the relevance to the establishment of a military standard Information Transfer System (ITS). The requirements driving the changes from older avionics systems are listed, and the importance of hierarchical interconnections in multilevel, multiplexed ITSs to provide lower level ITSs with functionally isolated communications media whenever data interchange is needed is stressed. Flow diagrams for three- and two-level ITSs are provided; a topology of the designs includes functional isolation between critical flight subsystems. New subsystems such as fire control, stores management, weapon guidance, and release will be combined into one subsystem. Independently operating subsystem bus networks will be tied together by higher order systems operating between 1-50 MHz. M.S.K.

A82-13518 # **Advanced fiber optic systems for avionics applications.** B. E. Kincaid (Lockheed Research Laboratories, Palo Alto, CA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 507-513. 27 refs. (AIAA 81-2319)

The application of fiber optic (FO) systems to avionics is considered, with emphasis on the design of electronic warfare (EW) systems requiring high-speed, real-time data transfer busing and wavelength multiplexing. Single star, three in-line star, and three fully-interconnected star FO data bus architectures are compared with respect to optical loss equations, maximum number of terminals, number of required fibers and bulkhead connectors, optical dynamic range required, and multipath levels for interconnected loop architectures. It is found that the single star configuration is optically superior to the two alternatives, although simplex stars must be added to the single star in order to lessen the installation cost and reliability disadvantages associated with the configuration's large number of fibers and the large pin count in a bulkhead connector. O.C.

A82-13519 # **Light-guided information distribution systems.** H. P. Lavin (General Electric Co., Aircraft Equipment Div., Utica, NY) and G. B. Harrold (GE Electronics Laboratory, Syracuse, NY). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 514-521. (AIAA 81-2320)

This paper examines the pervasiveness of light-guided communication systems into the avionics interconnect system. The capabilities and limitations of current technology are presented together with system architectural alternatives such as the use of wavelength multiplexing of time division and frequency division signals with various modulating schemes. Transducer design techniques for the conversion from electrical to optical signals and optical to electrical signals are presented with some of the limitations of conventional analytical techniques. The extension of light-guided communications into the avionics backplane enhances system growth capability and technological transparency by information broadcasting among the avionics modules. The experimental results of a preliminary light-guided backplane are presented using optics on a wire-wrap backplane to transfer digital clock, data, and control information for a maximum distribution to 40 loads. (Author)

A82-13520 * # On-board communication for active-control transport aircraft. L. D. Brock, A. L. Hopkins, Jr. (Charles Stark Draper Laboratory, Inc., Cambridge, MA), and J. L. Spencer (NASA, Langley Research Center, Hampton, VA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 522-529. Contract No. NAS1-15359. (AIAA 81-2321)

An investigation of active control communications sponsored by the NASA Langley Research Center is summarized. Particular attention is given to comparative architectures, for which a common set of requirements is generated as a baseline. Most of the requirements are aircraft functional in nature, such as stability and command augmentation, structural load relief, flight path control, flight control linkage, flight monitoring, management, navigation, engine control, and ground communication; the time element, the hazard environment, and the communications capacity estimation are also important factors. The architectures involve several communication technologies, including dedicated links, broadcast busing, and multiplex busing. The multiplex bus system provides the greatest flexibility and installation efficiency. A future homogeneous network system is also proposed, which would be fault and damage tolerant and would, with advanced technology, avoid the problems of designing a very large and flight critical multiplex bus system. J.F.

A82-13525 * # Digital detection and processing of laser beacon signals for aircraft collision hazard warning. L. M. Sweet, R. B. Miles, G. F. Russell, M. G. Tomeh, S. G. Webb, and E. Y. Wong (Princeton University, Princeton, NJ). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 563-571. 15 refs. Grants No. NCC2-94; No. NGL-31-001-252. (AIAA 81-2328)

A low-cost collision hazard warning system suitable for implementation in both general and commercial aviation is presented. Laser beacon systems are used as sources of accurate relative position information that are not dependent on communication between aircraft or with the ground. The beacon system consists of a rotating low-power laser beacon, detector arrays with special optics for wide angle acceptance and filtering of solar background light, microprocessors for proximity and relative trajectory computation, and pilot displays of potential hazards. The laser beacon system provides direct measurements of relative aircraft positions; using optimal nonlinear estimation theory, the measurements resulting from the current beacon sweep are combined with previous data to provide the best estimate of aircraft proximity, heading, minimium passing distance, and time to closest approach. (Author)

A82-13526 # An operational model of specific range for microprocessor applications in piston-prop general aviation airplanes. R. C. H. Parkinson. In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 572-579. 19 refs. (AIAA 81-2330)

This paper presents a fuel-efficient cruise performance model which facilitates maximizing specific range of General Aviation airplanes powered by spark-ignition piston engines and propellers. Airplanes of fixed design only are considered. Specific range is the ground distance the airplane flies per unit mass of fuel consumed in cruising flight. The cruise performance model determines the specific range, engine inlet manifold pressure, engine fuel-air mass ratio and engine fuel flow rate which correspond to any given values of geocentric true windspeed along track, equivalent airspeed, airplane gross weight, airplane longitudinal center of gravity position, auxiliary equipment power usage, engine rotational speed, pressure altitude and atmospheric ambient temperature. The use of the cruise performance model for maximizing specific range, with and without constraints on the airplane operation, is discussed. The cruise performance model appears suitable for airborne microprocessor implementation. Improvements in specific range, which are expected to result from implementation of the cruise performance model, are given. The principal hardware items necessary for such implementation are listed. (Author)

A82-13527 # Design and flight test of a lateral-directional command augmentation system. D. Atzhorn (USAF, Washington, DC) and R. F. Stengel (Princeton University, Princeton, NJ). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 580-592. 14 refs. Contract No. N00014-78-C-0257. (AIAA 81-2331)

Two-input/two-output lateral-directional control laws with Type 0 and Type 1 structures have been designed, analyzed, and flight-tested using the microprocessor-based digital flight control system (Micro-DFCS) installed in Princeton's Variable-Response Research Aircraft (VRA). These control laws were designed using linear-quadratic sampled-data regulator theory, and they were evaluated by U.S. Navy test pilots. Major closed-loop response features were found to be relatively insensitive to sampling rate (down to 4 sps), although flying qualities were degraded by increased sampling delay. Type 0 controllers provided satisfactory performance in flight, but the equivalent Type 1 systems were found to be unduly sensitive to disturbances and measurement noise. A novel application of the Tustin transformation proved useful in control law implementation. (Author)

A82-13529 # Fiber-optic immunity to EMI/EMP for military aircraft. M. K. Zaman (Lockheed-California Co., Burbank, CA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 597-599. (AIAA 81-2339)

Fiber-optic interconnect technology is specifically suited for military aircraft. This paper addresses a major factor of the fiber-optic interconnect technology, namely, the fiber-optic immunity to EMI/EMP, including power line transients and lightning strike. Transmission systems using fiber-optic cables (interconnect) are similar to those using electrical cables (balanced shielded twisted pairs), except that the output of the transmitter is used to modulate a light source. A photodetector responds to the light transmitted by the optical fiber, producing an electrical signal corresponding to the output of the modulated source. This signal can then be processed in a conventional manner in the system. In general, fiber-optic cables are not susceptible to EMI, provide good electromagnetic isolation between circuits, provide wide bandwidth, and are lightweight. Fiber-optic cable characteristics will be explored for shielding effectiveness. The EMI tests conducted to quantify the EMI benefits of fiber-optic cables in aircraft environments will also be discussed. No information related to transient radiation effects on electronics (TREE) is presented in this paper. (Author)

A82-13530 # Real-time flight management avionics software system. J. Chelini and R. H. Farmer (General Motors Corp., Delco Electronics Div., Goleta, CA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 600-607. (AIAA 81-2340)

Recently, the U.S. Air Force evaluated several varieties of Fuel Savings Advisory Systems (FSAS) including a Flight Management System (FMS) considered in the reported investigation. It is pointed out that the engineering effort to provide Flight Management Systems for commercial and military applications is extremely software intensive. To minimize software development efforts, an enlargement of the abstract computing machine was required. This resulted in the development of a kernel. A description is provided of the history associated with the development of a kernel and its use in FMS applications. It is demonstrated that through the use of solid software engineering methodology and proven operating system technology, Fuel Management System software is maintainable and error free, lending itself to a variety of configurations and demands with minimum software costs. G.R.

A82-13531 # Time-referencing of data in an asynchronous environment. B. D. Brumback (General Dynamics Corp., Fort Worth, TX). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 608-613. (AIAA 81-2341)

The time-referencing of data in an avionic system that is based on asynchronous processing is discussed. The time-tag counter, provided by MIL-STD-1553B, is used to precisely define the age of data. An avionic system, which uses three asynchronous multiplex buses, is discussed as an example. A timing-uncertainty error budget is defined and the corresponding position and velocity errors are negligible when compared with the errors in a high-quality navigation sensor. (Author)

A82-13532 * # A Loran-C prototype navigation receiver for general aviation. R. W. Lilley and D. L. McCall (Ohio, University, Athens, OH). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 614-620. 10 refs. Grant No. NGR-36-009-017. (AIAA 81-2329)

Investigations have been conducted regarding the techniques required for Loran-C navigation with application to the general-aviation pilot. The goal has been to produce prototype equipment for flight evaluation which will provide enroute navigation in both latitude-longitude and rho-theta coordinates and to evaluate the nonprecision approach capabilities of such equipment. In connection with the considered project, a prototype Loran-C receiver has been flight-tested using a variety of flight paths, with and without simultaneous ground radar position data collection. Attention is given to a receiver overview, an antenna preamplifier/coupler, the Loran-C receiver RF processor, the tracking loop hardware, tracking loop programming, video output, the laboratory and flight evaluation, and work currently in progress. G.R.

A82-13533 # Advanced weapon systems - Integration technology. M. J. Thullen (USAF, Avionics Laboratory, Wright-Patterson AFB, OH). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 621-628. (AIAA 81-2213)

The Digital Avionics Information System (DAIS) is discussed. DAIS has been characterized as a system architecture which can be applied and configured for a broad class of avionics applications and missions utilizing digital technology to reduce life cycle costs by defining and developing modular hardware and software core elements and standardized interfaces which can be configured and applied to many aircraft. The DAIS approach reflects a total system concept rather than a functional subsystem or hardware oriented system. The DAIS architecture consists of federated processors communicating with each other and the other system elements through a standardized multiplex data bus. Advanced avionics concepts are discussed, taking into account information fusion, functional automation, integrated subsystems, advanced architecture, and aspects of concept validation. G.R.

A82-13534 * # Low cost programmable multisimulator facility. J. G. Kreifeldt (Tufts University, Medford, MA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1981, p. 629-632. 7 refs. Grants No. NsG-2156; No. NCC2-93. (AIAA 81-2229)

A prototype, low cost multisimulator facility consisting of a DEC LSI-11 host computer and multiple desk top simulators is reported. The facility includes a main-frame system, a voice system, and a multi-cab system which consists of a flight panel, a host subsystem, and a flight simulator system. Software components are described, and the simulator computer, which provides flight dynamics, a path predictor, and navigation and data communications is discussed. The system may be computationally upgraded by specification of the DEC LSI-11/23, thus obtaining at least a two-fold increase in real-time computational power. D.L.G.

A82-13600 † Divergence of a sweptforward wing (Divergentsiia kryla s obratnoi strelovidnost'iu). A. P. Seiranian. *Akademiia Nauk SSSR, Izvestiia, Mekhanika Tverdogo Tela,* Sept.-Oct. 1981, p. 133-138. 10 refs. In Russian.

Equations describing the divergence of a sweptforward wing are examined and found to contain a small parameter. The perturbation method for an arbitrary wing is used to obtain a formula relating the critical divergence rate with the basic characteristics of the wing. Numerical results are obtained using a variational method. P.T.H.

A82-13600 Civil aviation in China. R. Goodson. *Interavia,* vol. 36, Nov. 1981, p. 1098-1102.

An account is given of the present capabilities and development plans of the General Administration of Civil Aviation of China (CAAC), which has over 160 domestic routes, provides scheduled services to more than 80 Chinese cities, and operates 17 international routes. It is reported that, of the 120 airports in the People's Republic of China, only 12 can handle 707 airliner operations and less than 10 those of the CAAC's recently acquired *747SPs.* Among the operational problems cited are the use of 24 different aircraft types and the acquisition cost of such advanced aircraft as the Airbus A300. Of great importance is the ability of the CAAC to purchase aviation fuel directly from the Chinese government, at prices 10-20% lower than those privately owned airlines pay. Attention is given to airport facilities, research and agricultural aircraft operations, and the effects of regional government policy. O.C.

A82-13701 † Estimation of the efficiency of radioelectronic flight navigation systems (Otsenka effektivnosti radioelektronnykh pilotazhno-navigatsionnykh kompleksov). M. S. Iarlykov and A. S. Bogachev. *Radiotekhnika,* vol. 36, Sept. 1981, p. 7-12. In Russian.

A method based on the theory of Markov processes is developed for estimating the efficiency of flight navigation avionics. System components are modeled with three states, which makes it possible to investigate the permanent and temporary malfunctions. Particular attention is given to the selection of a criterion for the operational efficiency of the navigation system, and to the determination of operational states of the system. B.J.

A82-13703 † Digital signal processing on a background of rereflections for the international aircraft landing system (Tsifrovaia obrabotka signala mezhdunarodnoi sistemy posadki samoletov na fone pereotrazhenii). A. K. Berniukov. *Radiotekhnika,* vol. 36, Sept. 1981, p. 26-29. 7 refs. In Russian.

An analysis of multibeam signals in the time-reference scanning-beam (TRSB) system is presented for the case of rereflections and minimum a priori information. Algorithms of real-time digital processing are proposed, which make it possible to discriminate the signal from the rereflection, and to measure the information parameter. B.J.

A82-13652 * # Powered-lift takeoff performance characteristics determined from flight test of the Quiet Short-haul Research Aircraft /QSRA/. D. W. Riddle, R. C. Innis, J. L. Martin, and J. A. Cochrane (NASA, Ames Research Center, Moffett Field, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2409.* 14 p. 12 refs.

A powered-lift, reduced thrust takeoff performance program utilizing quiet short-haul research aircraft has been conducted. It has been shown that the powered-lift upper surface blowing concept greatly enhances aircraft takeoff performance. The improvements include: (1) takeoff field lengths may be shortened by approximately 30%; (2) Air Force critical field lengths may be shortened by approximately 60%; (3) powered lift upper surface blowing aircraft have better handling and performance characteristics than comparable conventional aircraft; and (4) the low speeds associated with powered-lift takeoff enhance safety margins. S.C.S.

A82-13653 * # Thunderstorm hazards flight research - Program overview. P. L. Deal, G. L. Keyser, B. D. Fisher, and N. L. Crabill (NASA, Langley Research Center, Hampton, VA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2412.* 11 p. 7 refs.

The NASA thunderstorm hazards research program, designed to study the effects of lightning strikes on the design and operation of aircraft, is described. An all-weather F-106B is instrumented to document the EM characteristics of direct and nearby strikes, measure the field parameters and analyze the ambient atmospheric content, and film the strikes; X-ray detectors are also on board, along with instrumentation for determining the frequency of visible light waveforms. Data is either recorded on-board or sent by telemetry to base, while ground based telemetry is used to direct the pilot and craft into regions of optimal lightning activity. The sensing apparatus is described, and ongoing programs to correlate different storm parameters are reviewed, along with operational procedures and safety precautions. Continued use of the craft through 152 storms and 16 direct hits, with no fatalities or circuit breaker throw, confirms the ability of metal skinned aircraft to withstand lightning strikes; data gathered from flights during 1980 are provided. D.H.K.

A82-13854 # **Enhanced F-15 air-to-ground flight demonstrations.** G. D. Gibbs (McDonnell Aircraft Co., St. Louis, MO). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2413.* 6 p.

Features designed to enhance the F-15 Eagle air-to-ground capabilities are presented. The F-15, intended to provide battlefield air superiority, has a thrust/weight ratio exceeding one-to-one; its armament systems are outlined. Built-in flexible digital avionics have allowed in-weather performance using synthetic aperture radar (SAR), high resolution mapping, and incorporation of an infrared laser sensor pod for use once in target range. The SAR has a resolution of 8.5 ft at 10 miles, suitable for detecting surface vehicles. The flight range has been extended with conformable fuel tanks, which, though adding a small drag increase beyond Mach 1, has doubled the internal fuel capacity; a full fuel load is now 5,120 gal, enough for more than a transatlantic flight. Two seven in. and four two in. CRT displays have been mounted in the aft cockpit, which now has complete flight control capability. Patch mapping, target identification, and blind bombing test flights are described. D.H.K.

A82-13855 # **The F-16/79 test program.** K. G. Timpson (General Dynamics Corp., Fort Worth, TX). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2414.* 8 p.

Flight certification testing for the F-16 fighter outfitted with a J79 engine (F16/79) is described. The use of the J79 engine required a new inlet, a new secondary air variable by-pass system, nacelle structural insulation blankets, and adaptation of the fire detection system and installation of a fire extinguishing system. The tests were concerned only with systems which were affected by the change of engine; 350 test runs were flown. Flight test procedures are outlined, chronography is provided, and instrumentation for real-time telemetry is discussed. A total of thirteen months elapsed between the decision to outfit the export version of the F-16 with a different engine and the completion of the flight certification trials; the results of the tests are now under review by the Air Force. D.H.K.

A82-13856 # **Organizing and training for innovative flight test management.** J. D. Lang (USAF, Wright-Patterson AFB, OH). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2416.* 8 p. 6 refs.

The organization and training for innovative flight test management by the 4950th Test Wing is reported. Current wing structure, methods, planned changes, and employer/employee relationships are discussed. An in-house training program to assist in the transition from old to new by enhancing attitudes and clarifying roles for improved leadership in test project and test engineering management is presented. Future emphasis is also discussed, and is to be on organizational attitude to encourage innovation and motivation to make each project succeed. D.L.G.

A82-13857 * # **Flight experience with a remotely augmented vehicle flight test technique.** K. L. Petersen (NASA, Flight Research Center, Edwards AFB, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2417.* 19 p. 7 refs.

A flight technique which uses the remotely augmented vehicle (RAV) concept is developed to flight test advanced control law concepts. The design, development and flight test validation of a RAV system mechanized on a digital fly-by-wire aircraft are described, and future applications are discussed. Flight experiments investigate complete inner loop, low sample rate, and adaptive control system mechanisms. The technique, which utilizes a ground-based FORTRAN programmable digital computer and up and down telemetry links is found to provide the flexibility necessary to effectively investigate alternate control law mechanisms in flight. D.L.G.

A82-13859 # **A technique to determine lift and drag polars in flight and their application.** A. Knaus (Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2420.* 13 p.

The paper presents performance trials of the European combat aircraft Tornado, which concentrate on techniques used to measure lift and drag polars. The polars are measured by means of well adapted test instrumentation, a data reduction system, and a high calibration standard for the aircraft and engines. Steady state and dynamic test maneuvers are combined, and result in a significant reduction in flight time required to obtain sufficient data for determining zero lift drag, induced drag characteristics, and drag increments due to aircraft configuration change. Flight test results are presented, which demonstrate the advantages of the test technique, the high data quality, and the feasibility of in-flight verification over the entire angle of attack range. D.L.G.

A82-13861 # **A cost effective method for the control of roll due to side slip on a low speed aircraft.** S. Chandrashekar and N. S. Kiran (Hindustan Aeronautics, Ltd., Flight Test Dept., Bangalore, India). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2422.* 5 p. 5 refs.

Dihedral effect and its control are important for increasing damping of dutch roll, as well as reducing roll damping and unstable spiral modes. The effectiveness of setting the wing-tips at large anhedral angles to reduce the dihedral effect is demonstrated for the case of a low wing piston trainer with a positive geometric dihedral. Results of flights conducted with four wing-tip an/dihedral values showed that the effective dihedral changed its sense when the aircraft was flown with a 30 deg wingtip anhedral; this change in sense occurred at about 10 deg tip-anhedral. The method was found to be both time and cost effective compared with conventional methods. Lack of agreement with analytical estimates indicates the need to review the analytical methods, which were based on results from wind tunnel measurements. J.F.

A82-13863 # **Performance estimation from non-steady manoeuvres.** K. R. Nippress (Aeroplane and Armament Experimental Establishment, Boscombe Down, Wilts., England). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2424.* 11 p.

Data obtained from non-steady manoeuvers on modern high performance aircraft have been analysed using least squares regression techniques to produce thrust drag models of the aircraft. Predictions of level speed performance, climb performance and turning performance have been produced from the model data and compared with data obtained from traditional test methods. The results presented in this paper demonstrate that use of non-steady techniques offers the possibility of decreasing the flight time required to perform a performance evaluation to approximately one quarter of the time required by traditional steady techniques. (Author)

A82-13869 # **Navy performance modeling techniques.** R. W. Boyd (U.S. Navy, Naval Air Test Center, Patuxent River, MD). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2431.* 5 p.

Details of airframe/engine/installation models combined with flight test data to achieve accurate performance modeling are presented. The airframe performance (drag) and engine performance (thrust) have separate computer programs which accompany the components from initial design to flight testing, and are updated with each modification to the hardware. Wind tunnel and flight test measurements are input as drag parameters while engine operational parameters are input into the thrust model. Once installation has been accomplished, a flight test model is developed which must be overlaid with the data from the initial thrust and drag models. A flowchart is presented for performance modeling, and the maneuvers and acceleration tests are described; the performance model is fed into a computer with graphics capability for analysis by project engineers. M.S.K.

A82-13871 * # HiMAT aerodynamic design and flight test experience. N. W. Matheny (NASA, Flight Research Center, Edwards AFB, CA) and G. N. Panageas (Rockwell International Corp., North American Aircraft Div., Los Angeles, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2433.* 18 p. 5 refs.

Consideration is given to the design phase of the highly maneuverable aircraft technology program. Design objectives are examined, noting full-scale design and the remotely piloted research vehicle. Attention is given to subsonic, transonic, and supersonic design. Design results are discussed with reference to aerodynamic efficiency, aeroelastic tailoring, and the flight test program. S.C.S.

A82-13872 # In-flight computation of helicopter transmission fatigue life expenditure. K. F. Fraser (Department of Defence, Aeronautical Research Laboratories, Melbourne, Australia). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2434.* 10 p. 5 refs.

Estimates of the safe fatigue life of critical helicopter transmission components may be made if in-service load data together with component fatigue data are available. Instrumentation has been developed to provide in-flight computation and indication of the current values of fatigue life expended for critical gears in single or twin-engine helicopter transmission systems. In addition basic transmission load data in the form of totalized times spent in a number of contiguous torque bands are continually updated and stored during flight. The basic load data together with values of life expenditure for critical gears for the current flight can be automatically printed out after flight. This development opens the way towards fatigue life monitoring of individual transmissions. (Author)

A82-13873 # Advancing blade concept /ABC/ development test program. A. J. Ruddell (United Technologies Corp., Sikorsky Aircraft Div., West Palm Beach, FL). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2437.* 10 p. 10 refs.

The Advancing Blade Concept (ABC) rotor system derives its name from the fact that the predominant lift load at high forward speeds is carried by the advancing blades on both sides of the aircraft. Since the retreating blades are not required to carry a significant fraction of the total lift load at forward speed, the speed and load factor limitations of the conventional helicopter due to retreating blade stall are eliminated. ABC development began in 1964. The XH-19A ABC demonstrator aircraft was designed as a research tool to investigate the ABC rotor characteristics. A brief review of the concept principles is presented along with a description of the test aircraft. It is pointed out that the XH-59A flight program has completed a successful demonstration of the ABC rotor system. The XH-59A has demonstrated significant maneuver and performance improvements over conventional helicopters. G.R.

A82-13874 * # Recent propulsion system flight tests at the NASA Dryden Flight Research Center. F. W. Burcham, Jr., L. P. Myers, J. Nugent, P. L. Lasagna, and L. D. Webb (NASA, Flight Research Center, Edwards AFB, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2438.* 13 p. 13 refs.

The article presents a summary of the propulsion system tests conducted on a number of aircraft at the NASA Dryden Flight Research Center. The tests included digital engine control systems, engine-inlet compatibility, inlet-airframe interactions, nozzle-boattail drag and advanced turboprop acoustics. Among the aircraft evaluated were the F-15, HiMAT, F-14, and the JetStar. S.C.S.

A82-13875 # C-5A unsurfaced taxi and off-load demonstrations. R. A. W. Brown (Lockheed-Georgia Co., Engineering Flight Test Div., Marietta, GA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2439.* 10 p.

The results of tests to evaluate the C-5A maneuvering and off-load capabilities on unsurfaced soils are presented. Clay-sand, sand, and silty clay soils with a CBR of nine were chosen for runways for the 665,000 lb fully loaded vehicle. Weight was gradually built up to the maximum, using a field with drop-offs no greater than six in. and driving at 5-10 knots. Conditions were created for dry sand, wet ground, snow, and frozen soil. Maneuvering was accomplished in ruts up to 8 in. deep in loose sand and 15-21 in. deep in snow; towing was not considered essential because the C-5A has rolling, rather than powered, wheels. The C-5A was judged operable under the test conditions, and recommendations are given for expanding the number of airfields available for the C-5A by using methods developed in the present tests as reference marks for soil evaluation. D.H.K.

A82-13876 # The Cessna T303 Crusader. T. E. Wallis and M. O. Schiegel (Cessna Aircraft Co., Wichita, KS). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2440.* 7 p.

The Cessna T303 Crusader is a six-place twin with a gross weight of 5150 pounds and an IFR equipped useful load of over 1850 pounds. Extensive initial computer and wind tunnel studies have resulted in an airplane with truly superb flying qualities. A cruciform tail configuration with a high aspect ratio horizontal tail, and advanced flow control devices in critical areas contribute much to these characteristics. The turbocharged 250 bhp engines have a unique turbocharger/compression ratio combination which provides excellent fuel economy. The paper describes the airplane and the development and certification flight test program. (Author)

A82-13877 # Government testing. J. C. O'Connor (U.S. Army, Aviation Research and Development Command, St. Louis, MO. *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2443.* 4 p.

The Department of Defense Directive on Test and Evaluation establishes the policy of conducting test and evaluation throughout the acquisition process of a defense weapon system. The acquisition process consists of four distinction phases, with each phase requiring a particular scope and type of test. This paper addresses the flight testing required for each acquisition phase during the development and production of Army aircraft. The test objectives, scope of tests, and test methodology are presented for the Preliminary Airworthiness Evaluation, Developmental Tests, Operational Tests, artificial/natural inflight icing, climatic laboratory tests, and the Airworthiness and Flight Characteristics Tests. (Author)

A82-13878 * # Flight test method for the determination of reciprocating engine cooling requirements. S. J. Miley, E. J. Cross, Jr. (Texas A & M University, College Station, TX), and D. L. Lawrence (Piper Aircraft Corp., Lakeland, FL). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2446.* 6 p. Grant No. NsG-1083.

It is pointed out that the effective cooling of aircraft reciprocating engines is still a problem area for the general aviation industry. Miley et al. (1981) have reported the results of an investigation of problems associated with cooling and installation aerodynamics. A description is given of a flight test procedure which was developed in connection with the considered investigation. It is shown that the test procedure provides valid cooling requirements data for a particular installation. The data are in terms of easily measurable parameters. The employment of the test procedure, which is based on the NACA cooling correlation method, can lead to more effective cooling installations and the solution of existing cooling problems. G.R.

A82-13879 # Performance assessment of an advanced reheated turbo fan engine. V. Zeidler (Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2447.* 15 p.

Testing and evaluation techniques for rating the performance of an advanced reheated turbofan engine are reported. Thrust, specific fuel consumption, and engine operational qualities are calculated for input into a computer. Thrust evaluation requires gross thrust and air mass flow measurements, which are taken as far as possible downstream from the engine, and are linked as input. Other options for thrust evaluation are described, noting that each possesses slight degradations in accuracy. Calibration curves are diagrammed for each option, and the performance evaluation of convergent nozzles is outlined. Calibration runs are performed in an altitude test facility (ATF) with totally controlled inputs to simulate the conditions in which test flights will be flown. Highest accuracy is obtained using linked methods and two engines in the ATF for performance and aircraft drag evaluation. M.S.K.

A82-13880 * # **Selected stability and control derivatives from the first Space Shuttle entry.** K. W. Iliff, R. E. Maine (NASA, Flight Research Center, Edwards, CA), and D. R. Cooke (NASA, Johnson Space Center, Houston, TX). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2451*. 16 p. 10 refs.

Primary stability and control derivative estimates garnered from the first Shuttle entry are reported. The craft was the first vehicle to maneuver over a wide range of hypersonic velocities, yielding data on flight characteristics from previously unexplored regimes. The flight envelope was confined to entry and safe landing, with no additional maneuvers to gain control data. Data for a Mach number range of 25-1.5 and altitudes of 515,000-50,000 ft are provided, and functional ranges of the Shuttle control surfaces and attitude jets are outlined. On-board systems gathered data on aerodynamic coefficient identification, flight condition and Euler angles, and jet chamber pressures. A maximum likelihood estimation program, which contained unknown stability and control derivatives, was used for control; a control input determined the value of the unknown derivatives, and the input and spacecraft response were measured. Longitudinal and lateral directional maneuvers and their derivative estimates are described, noting wind contamination of the sideslip measurements below Mach 3. Further maneuvering and stability tests are projected for subsequent flights. M.S.K.

A82-13881 # **Planning a helicopter flight test program.** K. Kuppuswamy and N. S. Kiran (Hindustan Aeronautics, Ltd., Flight Test Dept., Bangalore, India). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2381*. 6 p.

A study has been undertaken to assess the feasibility of completing the flight test program for the three different prototypes of the Advanced Light Helicopter, a high-performance twin-jet craft designed to operate under Indian conditions, within the 30 months allotted for the purpose. It was found that in order to achieve the 1000 hours of flight time required, all prototypes must carry identical instrumentation packages capable of making about 100 different dynamic, quasi-static and identifying measurements, with a fourth package as backup. Analysis of the weight of such an instrumentation package indicates it to contribute about 400 kg to the weight of the helicopter, with one third of the total represented by cables and connectors. Cost estimates reveal over 50% of the program cost per flight hour to be accounted for by insurance and depreciation, while the more controllable engineering and flying costs make up only 33% of the total. Finally, a study of expected reliability, availability and maintainability of the test vehicle, airborne data acquisition system and telemetry system reveals that they are compatible with the planned schedule. S.C.S.

A82-13888 # **Recent improvements at the Naval Air Test Center for increased test system flexibility.** T. F. Coyle, G. A. Davis, and G. R. Ryan, Jr. (U.S. Navy, Naval Air Test Center, Patuxent River, MD). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2392*. 10 p.

Improvements that have been made in two real-time systems used daily at the Naval Air Test Center are described. The systems are the Real-time Telemetry Processing System (RTPS) and Range Computation and Control System (RCCS). The improvements have made possible (1) rapid changes to real-time application programs; (2) increased flexibility in data reduction; (3) increased capability in data analysis; and (4) increased capability in range control systems. It is pointed out that these improvements will enable the RTPS and the RCCS to provide the necessary support for the test and evaluation of both vehicles and mission systems at the center in the 1980's. C.R.

A82-13891 # **Flight testing the nonmetallic spline coupling technology at the Naval Air Test Center.** P. F. Zalesak, Sr. (U.S. Navy, Naval Air Test Center, Patuxent River, MD). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2405*. 12 p. 18 refs.

Results of a flight test program are discussed and data are presented in support of the contention that the nonmetallic spline coupling technology can be used to reduce unwanted oscillatory torsional loads transmitted between components. It is shown that the nonmetallic spline coupling technology can be applied to existing hardware systems to improve the reliability of components used to transmit torque. In the test, transmitted torsional load data, as measured at the engine driven compressor test drive shaft, were collected during several flight phases, including takeoff, takeoff abort, negative torque system check, loiter flight conditions at 500 feet and 200 knots indicated airspeed, inflight engine shutdown, inflight engine start up, landing and ground backing up operations. C.R.

A82-13892 # **Commentary on facilities used in the development of a Sea Harrier all weather operations capability.** J. W. Britton (Royal Aircraft Establishment, Bedford, England). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2407*. 8 p.

The resolution of difficulties inherent in developing an all-weather V/STOL aircraft (Sea Harrier) for sea operations is described, along with the test facilities used for the program. Reduced visibility, which restricts pilot instrument use after a certain point while landing, were explored with flight simulators with four-axis motion. The simulator provided motion fidelity, head-up displays, realistic visual and environmental conditions (digital computer controlled), and a TV video system. Additional flight test use was made of a Harrier two-seater equipped with blinds to alter visibility. Visual guidance aids comprising flashing red and white lights and runway markers were employed to provide strong visual cues for pilot orientation during approach. The advantages of having all equipment on-site are stressed, as data from one test is then available for simultaneously run test phases. D.H.K.

A82-13894 # **Information technology and its impact on test and evaluation at the Naval Air Test Center.** R. K. Fairfax, T. C. Lancaster, and G. F. Hurlburt (U.S. Navy, Naval Air Test Center, Patuxent River, MD). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2396*. 7 p. 13 refs.

An investigation is conducted regarding the approaches used by the Naval Air Test Center to provide data collection, reduction, and computer support requirements for full-scale aircraft development programs such as the F/A-18, AV-8B, and LAMPS MK-III. Aspects of initial real-time development are discussed, taking into account network components, the data transmission network, the fiber optic cable, the interface equipment, the real-time processor, telemetry application, questions of range application, and problems of graphics application. A description of a satellite communications demonstration is also provided. G.R.

A82-13898 # **Georgia Tech coherent jammer flight test.** H. W. Andrews and D. L. Gordon (Georgia Institute of Technology, Atlanta, GA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2452*. 7 p.

A test program to accurately measure the interaction between a coherent jammer and a radar is described. Theoretical calculations comprised finding closed form solutions for the jammer/radar interaction, and considered slant range antenna patterns, radar cross section, frequency, polarization, and scenario geometry, in addition to the development of computer programs to study electronic countermeasures techniques. A jammer was devised to meet the specifications derived from the analytical work and mounted on a test aircraft with 14 track analog pulse-to-pulse recording equipment.

The data acquisition systems and data flow are diagrammed and experimental procedures are outlined for a radar pulse ratio frequency of 2800 Hz and a pulse width of 0.5 microsec. The plane will follow head-on, zig-zag, and constant off-set flight paths toward the radar to test the jammer capabilities. D.H.K.

A82-13903 # **Fleet Flight Loads Survey monitoring and analysis techniques.** D. A. Rakin (Grumman Aerospace Corp., Bethpage, NY). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2461.* 12 p.

The F-14 Fleet Flight Loads Survey program collected data from operational fleet aircraft for the generation of full-scale fatigue test spectra and fatigue design criteria. Thirty-five channel tape recorders were installed in each of four fleet aircraft to measure aircraft kinematic parameters, surface position, and airframe strains. Computer software was developed to reduce the data to the form of exceedance plots and bivariate exceedance tabulations. Regression equations were generated from structural flight test data and used to generate exceedance plots of major airframe surface loads. J.F.

A82-13906 * # **Flight test experience with high-alpha control system techniques on the F-14 airplane.** J. Gera, R. J. Wilson, E. K. Enevoldson (NASA, Flight Research Center, Edwards, CA), and L. T. Nguyen (NASA, Langley Research Center, Hampton, VA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2505.* 22 p. 5 refs.

Improved handling qualities of fighter aircraft at high angles of attack can be provided by various stability and control augmentation techniques. NASA and the U.S. Navy are conducting a joint flight demonstration of these techniques on an F-14 airplane. This paper reports on the flight test experience with a newly designed lateral-directional control system which suppresses such high angle of attack handling qualities problems as roll reversal, wing rock, and directional divergence while simultaneously improving departure/spin resistance. The technique of integrating a piloted simulation into the flight program was used extensively in this program. This technique had not been applied previously to high angle of attack testing and required the development of a valid model to simulate the test airplane at extremely high angles of attack. (Author)

A82-13907 # **Flight testing De Havilland Aircraft Limited DASH-8 utilizing onboard data analysis by microprocessor.** W. M. Gibson (De Havilland Aircraft of Canada, Ltd., Downsview, Ontario, Canada). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, FLight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2507.* 8 p.

The DASH-8 is a 30- to 36-passenger high-wing T-tail STOL airliner, powered by two turboprop engines driving hydromatic four-bladed propellers with full blade angle control. The aircraft is designed to meet commercial market requirements in the passenger, cargo, and executive transport roles with concentration on aerodynamic cleanliness to produce an energy efficient aircraft with low operating costs. The STOL criteria are related to requirements for a 3000 ft field length. A microprocessor was selected to perform the onboard data analysis task for the DASH-8. Attention is given to the basic instrumentation system, the microprocessor data stream interface, data analysis by onboard computer, and examples of onboard data analysis. G.R.

A82-13908 # **Application of a microprocessor controlled cockpit display for enhanced pilot control of flight test maneuvers.** M. J. Burke and E. W. Ferris (Grumman Aerospace Corp., Calverton, NY). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2510.* 4 p.

Pilot 'overshoot' of the desired flight test conditions due to malfunctioning or inadequate cockpit displays has been a continuing problem. In addition, monitoring multiple parameters during dynamic maneuvers is difficult for the pilot. Structural flight testing utilizes indirect parameter ('g') for actual structural strain values resulting in poor predictability of strain values during a maneuver. A Microprocessor Crew Display (MCDS) was generated to meet this need. It consists of a 'bargraph' light emitting diode display, two CRT's and a caution/warning light. A total of five parameters can be selected and displayed at one time. Flight experience with the MCDS indicates more precise and quicker control of the aircraft, reduced probability of 'overshoot', increased flight safety and reduced flight test time. (Author)

A82-13910 * # **Direct strike lightning measurement system.** M. E. Thomas (NASA, Langley Research Center, Hampton, VA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2513.* 8 p. 6 refs.

A research data system developed for in-flight measurement of direct and nearby lightning-strike characteristics is described. The measurement system consists of a wide-band analog recorder which records the continuous lightning scenario and fast sample-rate digital transient recorders with augmented memory capacity for increased time resolution of specific times of interest. Electromagnetic sensors with bandwidths exceeding 100 MHz are used which respond to rates of change of the quantities being measured. Data system immunity from electromagnetic interference is accomplished by the use of a dynamotor for power isolation, shielded system enclosure and fiber-optic data links. (Author)

A82-13911 # **Instrumentation to determine the suitability of RNAV systems for helicopter navigation in the national airspace system /NAS/.** J. Gallagher and R. D. Till (FAA, Technical Center, Atlantic City, NJ). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2514.* 9 p. 14 refs.

This paper describes instrumentation developed and flight testing conducted by the Federal Aviation Administration (FAA), Technical Center, to determine the suitability of RNAV systems for helicopter navigation. A data collection package consisting of a militarized minicomputer interfaced to aircraft sensors and RNAV systems typically representative of LORAN-C, GPS, Inertial Navigation, and Omega was designed and fabricated. A portable low cost position tracking system was devised for non-precision approach navigation tests by Kalman filtering post flight position data derived from a pulsed radar ranging system with inertial and air data measurements, resulting in improved position accuracy. (Author)

A82-13913 * # **Rotor systems research aircraft /RSRA/ rotor force and moment measurement system.** J. S. Burks (NASA, Ames Research Center, Moffett Field, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2516.* 12 p.

The two Rotor Systems Research Aircraft (RSRA) are flight vehicles with unique measurement capabilities. The primary goal of the RSRA is direct measurement of rotor forces and moments in flight. This is accomplished through a rotor force and moment measurement system comprised of load cells and/or hydro-pneumatic isolator units which are integral to the aircraft structure. Due to structural flexibility, the aircraft must undergo a physical calibration. A static calibration of the first RSRA has been completed, and data analysis has progressed through determination of a linear calibration algorithm. Design, development, and operation of the RSRA rotor force and moment measurement system and the Static Calibration Facility are described, and results of the calibration are presented. (Author)

A82-13916 # **The Air Force Flight Test Center - Utah Test and Training Range in the 1980's.** C. E. Adolph (USAF, Flight Test Center, Edwards AFB, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2487.* 9 p.

The Air Force Flight Test Center (AFFTC) conducts and supports manned and unmanned aircraft flight tests, development testing of parachutes, operates the Edwards Flight Test Range, the USAF Test Pilot School and the Utah Test and Training Range. This paper summarizes the evolutionary forces in the technical and management areas which gave impetus to today's methods of operation. Current capabilities and procedures are then described, followed by a discussion of improvements planned to meet the demands of the mid to late 1980's. (Author)

A82-13917 # **The need for, and development of, a simulation facility at the Naval Air Test Center.** B. L. Hildreth and A. C. Cruce (U.S. Navy, Naval Air Test Center, Patuxent River, MD). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2488.* 9 p.

Attention is given to the problem created by, on the one hand, rapidly rising test costs and, on the other, the increasing test requirements to satisfactorily evaluate systems of ever increasing complexity. A partial solution to this problem is to raise the productivity of the testing performed in terms of quantities of data gathered per dollar or per flight hour. Four benefits of a combined flight test/simulation program are cited: improved safety, increased productivity, ability to test modern, complex, highly integrated systems, and the capability to test system performance against simulated threat environments. The requirements for a facility design based on these factors are discussed, and the current progress of the Naval Air Test Center toward developing a facility to meet these requirements is covered. C.R.

A82-13919 * # **A unique integrated flight testing facility for advanced control/display research.** V. M. Batson, J. J. Hatfield (NASA, Langley Research Center, Hampton, VA), and N. E. Novack (NASA, Wallops Flight Center, Wallops Island, VA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2490.* 11 p. 13 refs.

NASA is engaged in programs aimed at developing avionic concepts and systems technology for air transportation systems of the 1980's and beyond. A part of these programs is related to the development of advanced concepts and avionics technology for integrated displays and controls. In support of these efforts an interactive Flight Display Research System (FDRS) has been developed as an integral part of integrated flight test facilities which have been used in evaluation studies of integrated display and control concepts in support of a VTOL Approach and Landing Technology (VALT) program and current Terminal Configured Vehicle (TCV) program. A description is provided of several of the advanced integrated display and control concepts that have evolved within the VALT, TCV, and general aviation programs, as well as the integrated flight test facilities. G.R.

A82-13921 # **Collection and simulation of spatial infrared signatures of military jet aircraft.** W. D. Foster and H. I. Register (USAF, Eglin AFB, FL). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2494.* 6 p.

The 3246th Test Wing at Eglin Air Force Base has developed airborne systems capable of collecting high resolution infrared data from ground and airborne targets. The beam approach seeker evaluation system includes test guidance units, spatial scanners, television cameras with missile track points and a laser ranger. Infrared target simulation is designed to reproduce the infrared spatial data collected by the high-resolution instrumentation system. The two approaches to this concept are the miniature filament approach and the thermochromics approach which uses VO2. S.C.S.

A82-13922 # **Flight testing the suspended maneuvering system.** R. K. Svec (McDonnell Douglas Corp., St. Louis, MO). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2498.* 8 p.

The Suspended Maneuvering System (SMS) has been developed as a rapid-response rescue vehicle that expands the capabilities and versatility of today's rescue methods. Suspended from a helicopter, the SMS is maneuvered horizontally by an onboard operator using an advanced thrust control system. This unique concept, an adaptation of modern aerospace technology, provides access to places considered inaccessible or hard to reach with conventional emergency equipment. Combating fires in high-rise buildings is one major SMS application. The flight test program concentrated on tests at a simulated high-rise building to develop the capability and techniques for 'docking' at windows and subsequent personnel entry and egress through the windows. (Author)

A82-13924 # **Improved techniques for the calibration and measurement of in-flight loads.** K. A. Birk and R. L. Kuebrich (McDonnell Aircraft Co., St. Louis, MO). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2502.* 10 p.

Techniques are presented for the calibration of strain gage bridge circuits installed in the F/A-18 wings. Methods are described which develop equations to solve for the traditional shear, bending moment, and torsional loads for a variety of flight conditions. The major improvements described are: the use of zone loading techniques to enhance strain gage slope determination from the calibration loads; the application of a family of flight equivalent distributed loads to better assess equation accuracy; and the formulation of computer aided analysis techniques which allow review of larger volume of data while requiring fewer manhours. (Author)

A82-13928 # **Overview of flight and ground testing with emphasis on the wind tunnel.** J. D. Whitefield (Sverdrup Technology, Inc., Tullahoma; Calspan Field Services, Inc., Arnold Air Force Station, TN), B. J. Griffith, R. W. Butler (Calspan Field Services, Inc., Arnold Air Force Station, TN), and C. Bang (USAF, Arnold Air Force Station, TN). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2474.* 11 p. 32 refs.

A general overview of the development of (1) aircraft and missiles, (2) the wind tunnel, and (3) the emerging role of computational techniques is given. Special comparisons between ground test data and flight data from aircraft, space vehicles, and reentry vehicles are made. The paper discusses some of the historical development of aircraft and ground testing with emphasis upon how computational fluid dynamic (CFD) techniques aid both the design and ground testing of flight vehicles. The speed regimes covered include low speed, the transonic regime, supersonic and reentry speeds. The methodology development made possible by the advent of CFD will be illustrated. Finally, likely future trends in ground test facility development, full-scale flight testing and CFD are discussed. The future role of ground testing and CFD in the development of aircraft and missiles in the 1980's and 1990's is assessed. (Author)

A82-13929 # **F-4 Advanced Avionics Flight Test.** H. A. Tracy (USAF, Eglin AFB, FL). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2464.* 6 p.

Testing the integration of a new digital avionics navigation and weapon delivery system, including the interface with its sensors, into an aging aircraft with an analog system can be filled with problems. During previous flight tests, a 3/1 ratio of flown/productive flights was experienced. A current productivity rate approaching 100% can be related to pre-mission testing of software, and real-time display of test data. Pre-mission testing consists of loading the test software into a test simulator, and performing simulated tasks to verify operation of the test software prior to loading it into an aircraft for flight. Real-time display of test data is accomplished by inserting a software overlay into the airborne computer which outputs data to an external instrumentation pod, where the data are recorded and transmitted via microwaves to the ground control facility. The displayed data include switch settings, system errors, ground track of the aircraft, and software discretes. (Author)

A82-13930 # **F/A-18 high authority/high gain digital flight control system development and flight testing.** R. A. Burton and B. T. Kneeland, Jr. (U.S. Navy, Naval Air Test Center, Patuxent River, MD). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2465.* 8 p. 6 refs.

The F/A-18 airplane employs a fly-by-wire, full authority/high gain digital flight control system (FCS) which at times can completely dominate aircraft response to pilot inputs, resulting in higher order system responses that are a new and significant challenge for the flight test engineer to analyze. This paper overviews the development of the F/A-18 digital FCS, detailing changes to the programmable read only memory (PROM) flight control laws to correct flying qualities problems. In addition, a summary of the advanced stability and control test techniques and data analysis procedures used are presented and it is demonstrated how these techniques can quantify complex changes in flight control laws. These techniques consist of a maximum likelihood parameter identification program used to perform an equivalent system analysis. Data are presented which demonstrate the success the airframe contractor has had in reducing overall system equivalent time delays. (Author)

A82-13931 * # **The development and flight test evaluation of an integrated propulsion control system for the HiMAT research airplane.** J. L. Baer-Riedhart (NASA, Flight Research Center, Edwards AFB, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2467.* 10 p. 8 refs.

The Highly Maneuverable Aircraft Technology airplane is a .44-scale version of an advanced fighter design. It is remotely piloted from a ground cockpit and is powered by a J85-GE-21 turbojet engine. The engine is electronically controlled by a digital computer onboard the airplane to operate at selected engine operation modes. The HiMAT design and development philosophy emphasized high-risk, low-cost and minimum testing, and also required that no single failure would cause loss of the vehicle. This philosophy generated unique requirements for design, computer simulation methods, specialized test techniques, and support systems which are discussed in this paper. (Author)

A82-13936 # **Comparison of low-speed handling qualities in ground-based and in-flight simulator tests.** M. F. C. van Gool (Nationaal Lucht- en Ruimtevaarlaboratorium, Amsterdam, Netherlands) and N. C. Weingarten (Calspan Advanced Technology Center, Buffalo, NY). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2478.* 9 p. 9 refs. Research supported by the Nederlands Instituut voor Vliegtuigontwikkeling en Ruimtevaart and Rijksluchtvaartdienst; Contract No. F33615-79-C-3618.

Approaches and landings have been carried out using the Total In-Flight Simulator (TIFS) to validate results of experiments on a ground-based simulator in which handling qualities of transport aircraft equipped with advanced flight control systems were the subject of investigation. The configurations featured rate-command/attitude-hold in the pitch and roll axes. Variation of equivalent short-period frequency, pitch rate overshoot, value of the normal acceleration sensitivity parameter, direct lift control, roll damping and roll time delay was studied. The results indicate that the ground-based investigation predicted the outcome of the in-flight experiments very well with the exception of the case with direct lift control in which objectionable normal accelerations were felt in flight that were not noticed during the ground-based simulation. (Author)

A82-13938 * # **Powered-lift STOL aircraft shipboard operations - A comparison of simulation, land-based and sea trial results for the QSRA.** V. C. Stevens, D. W. Riddle, J. L. Martin, and R. C. Innis (NASA, Ames Research Center, Moffett Field, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2480.* 16 p. 10 refs.

A moving base carrier landing flight simulation using NASA's Quiet Short-Haul Research Aircraft (QSRA) was conducted during the design and fabrication of the QSRA. After completing its initial flight testing, the QSRA flew simulated carrier landings on land, followed by actual carrier landings at sea. This paper compares the simulated flight characteristics used in the flight simulation (using an aircraft math model based on wind tunnel data) with the aircraft flight characteristics obtained from flight test data. This paper also compares the results of the QSRA flight simulation carrier landings, the land based simulated carrier landings, and the actual carrier landings. (Author)

A82-13939 * # **A large-scale investigation of engine influence on inlet performance at angle-of-attack.** B. K. Hodder, B. W. Farquhar (Boeing Commercial Airlane Co., Seattle, WA), and M. R. Dudley (NASA, Ames Research Center, Moffett Field, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2481.* 13 p. 6 refs.

A low-speed wind tunnel test was conducted in the NASA/Ames 40-x-80-foot wind tunnel to investigate the effect of engine/inlet flowfield interaction on inlet performance near flow separation. The effect of engine/inlet flowfield interaction was determined by comparing the performance of a large-scale subsonic inlet (CR = 1.26) close-coupled and remote-coupled to a TF-34 turbofan engine. The remote coupled inlet configuration removes the influence of the engine on the inlet flowfield and further, typifies conventional small-scale inlet test techniques which generally provide no simulation of turbomachinery effects. Test results indicated that engine interaction allows the inlet to operate with lower distortion levels at and beyond the separation angle-of-attack attained without engine interaction. (Author)

A82-13940 # **Naval Weapons Center - Test and evaluation in the 1980's.** R. V. Boyd (U.S. Naval Weapons Center, China Lake, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2485.* 10 p.

The Naval Weapons Center (NWC) at China Lake, CA, has test and evaluation missions that include strike weapons for land and sea targets, air-to-air systems, antiradiation missiles, and antiship missile defense systems. NWC facilities are outlined, noting current programs that comprise new warheads, propulsion systems, guidance and control units, and missiles with extended range, higher speeds, and multiple target capability. Modernization efforts comprise an on-axis data system, a real-time radar/optics system for precision space position, velocity, and acceleration measurements, a metric video TV system, a telemetry data acquisition system, upgraded range communication, timing and control systems, and airspace surveillance system enhancement. A range control center, centralized and technically current, will provide direct support for weapons testing, provide test data packaging, and be able to support several simultaneous tests. D.H.K.

A82-13941 # **Two at a time - Flight test plans for the new Boeing airliners.** B. S. Wygle (Boeing Co., Seattle, WA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2378.* 5 p.

Contracts regarding the sale of a new 200-passenger medium-range airliner and a 170-passenger short- to medium-range airliner led to a situation in which the first airliner of one type is to be delivered in January 1983, about five months after delivery of the first aircraft of the other type. The flight test programs will substantially overlap during 1982 and create an unprecedented work level during that year. To manage the work load, the company has developed a flight test computer system and a training program for engineers. Remote test sites have been selected to provide good weather conditions and low traffic levels. G.R.

A82-13942 # **Operational evaluation of the new generation of jet transport aircraft.** C. R. Foster (FAA, Seattle, WA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2377.* 12 p.

Within the Lead Region for Transport Aircraft, the FAA is upgrading its capability for operational evaluation of the new generation of transport aircraft. The responsibilities of the Certification and Flight Standards Divisions are described with emphasis on the role of the FAA's Aircraft Evaluation Groups (AEG). The AEG's ensure that the necessary FAR 121, 91, 61 and other operating rules can be met by new aircraft at the time the aircraft enter line service. The AEG's also address aircraft operations policies described in FAA advisory material, or ICAO standards for airport, facility and ATC compatibility. Specific topics covered include the type rating, training and maintenance programs, minimum equipment lists, crew workload and crew complement evaluation, and continued operational support after entry into service. (Author)

A82-13944 # **Flight test concept evolution.** L. G. Van Pelt (USAF, Eglin AFB, FL). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2375.* 11 p.

A chronicle of progress in flight test philosophy is very revealing. Ever-increasing emphasis has been placed upon the need for flight test to be thorough and still meet the need for timely introduction of effective new aircraft into the operational inventory. Major flight test concepts (Phase Testing, Category Testing, and Development Test and Evaluation/Operational Test and Evaluation) have been influenced by nuances such as concurrency, fly-before-buy, total package procurement, prototyping, competitive fly-off, etc. An understanding of these experiences and lessons learned will help in today's preparation of effective and efficient test programs. (Author)

A82-13945 # **Electro-optical vector scoring system.** R. Rackauskas (U.S. Navy, Pacific Missile Test Center, Point Mugu, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2373.* 6 p.

An electrooptical vector scoring system has been developed for miss-distance scoring in fleet training exercises and for the testing and evaluation of weapon systems. The system utilizes solid state light emitting GaAs diodes which emit extremely short pulses of infrared radiation at 0.9 micron wavelength. The raw data obtained (range, azimuth angle, time) can be used to determine the relative velocity vector. A line drawn perpendicular to the relative velocity vector that passes through the center of the vector scoring system determines the miss distance. Score data is telemetered to a ground computer that computes velocity vector, miss distance, and the missile's attitude angle relative to the target. S.C.S.

A82-13946 * # **The development and use of a computer-interactive data acquisition and display system in a flight environment.** G. A. Bever (NASA, Flight Research Center, Edwards, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2371.* 16 p. 6 refs.

The flight test data requirements at the NASA Dryden Flight Research Center increased in complexity, and more advanced instrumentation became necessary to accomplish mission goals. This paper describes the way in which an airborne computer was used to perform real-time calculations on critical flight test parameters during a flight test on a winglet-equipped KC-135A aircraft. With the computer, an airborne flight test engineer can select any sensor for airborne display in several formats, including engineering units. The computer is able to not only calculate values derived from the sensor outputs but also to interact with the data acquisition system. It can change the data cycle format and data rate, and even insert the derived values into the pulse code modulation (PCM) bit stream for recording. (Author)

A82-13947 # **Automatic digital gain ranging.** E. G. Hanson (Grumman Aerospace Corp., Bethpage, NY). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2370.* 5 p. 13 refs.

A logic circuit has been patented that automatically up-scales and down-scales digitized voice or data transmissions in response to variations in input amplitude. Although it was originally developed to compress flight test telemetry data, the circuit can also be used advantageously in 'companding' (data or voice compression and expansion) applications that are widely encountered in the communications industry. In this specialized application the circuit can be made to yield a close approximation to the 'mu-law' characteristic which is an accepted standard in this country. Complementary logic circuitry will also be described for expanding compressed digital transmissions to their original linear digital form. (Author)

A82-13948 # **The Advanced Range Instrumentation Aircraft improvement and modernization program.** J. S. Nash (USAF, Systems Engineering Branch, Wright-Patterson AFB, OH). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2368.* 4 p.

The Advanced Range Instrumentation Aircraft (ARIA), seven EC-135 aircraft configured for reception, recording and real-time relay of telemetry data, are being retrofitted with new instrumentation to meet user's requirements for mobile telemetry collection and retransmission through the turn of the century. Two sets of ARIA Prime Mission Electronic Equipment have been transferred to C-135B aircraft with TF-33 fan engines. Additional conversions will utilize Boeing 707-320Cs. Instrumentation changes include new recorders, antennas, antenna control systems, feeds, tracking systems and telemetry receivers. (Author)

A82-13949 # **Lockheed Airborne Data System - Distributed microcomputers provide on-board real-time analysis.** J. A. Tabb (Lockheed-Georgia Co., Marietta, GA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2367.* 9 p.

This paper describes the more innovative features of the Lockheed Airborne Data System (LADS), and provides some insight into the high performance and cost effectiveness realizable by use of multiple processors in real-time data systems. LADS uses multiprocessors in a highly distributed configuration to control, verify, process, analyze and display data in real-time on board the test aircraft. The approach is to use remotely located signal-conditioner/multiplexer modules controlled in groups by distributed microcomputers which preprocess all incoming data. These microcomputers are synchronously controlled by a central data station which provides digital, analog, video and graphics displays of calibrated (engineering units) data in real-time to on-board test personnel. The airborne system includes an integral analysis computer station with graphics and hard-copy for real-time analysis. (Author)

A82-13955 # **F/A-18 Flight Test program overview - 1 September 1981.** E. R. Shields (McDonnell Aircraft Co., St. Louis, MO). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2351.* 9 p.

This report presents a F/A-18 Flight Test program overview including a discussion of pre-flight planning objectives. The flight envelope expansion program proceeded, subsequent to first flight, accumulating in excess of 2,600 flight hours in 24 months. Initial shipboard trials were completed successfully aboard the USS America. Navy/Marine pilot participation provided early customer inputs to the flight development process. Currently, the flight test program is nearing completion. Service Acceptance Trials and Navy Operational Evaluation are to be conducted during 1982. (Author)

A82-13956 # **Navstar Global Positioning System flight test program overview.** A. J. MacMillan (Aerospace Corp., El Segundo, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2350.* 9 p. Contract No. F04701-80-C-0081.

The Navstar Global Positioning System (GPS), which is now in the full-scale engineering development phase, is discussed. An overview of the program, including brief descriptions of the purpose of the program and of each of the three segments (space, control, and user equipment) is given. A description is also given of the test range at Yuma Proving Ground, Arizona, including the real-time laser tracking system. The development test and evaluation phase, extending from 1977 to 1979, is described, and some of the important results are presented. C.R.

A82-13962 # **Development of a lifting parachute to provide self-dispersing capability for an Avco-designed tactical munition.** R. J. Kingsley (Avco Corp., Avco Systems Div., Wilmington, MA) and J. D. Reuter (Pioneer Parachute Co., Inc., Manchester, CT). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1928.* 9 p.

This paper describes a program of analysis and test to develop a lifting parachute to provide ground dispersion for an assemblage of tactical munitions when air launched at low altitudes. A parachute lift-to-drag ratio of 0.3 to 0.4 will provide acceptable pattern length and width. Experiments were begun with parachutes of both ribbon and cruciform designs, but unusual packaging restrictions eliminated the ribbon design. Full-scale parachutes were first evaluated for low-speed lift performance, and then tested in a transonic wind tunnel. Free flight tests were performed with a stack of four munitions using a special rail-launched booster rocket facility. The sequencing, or spacing, of each munition in a stack is a critical factor in achieving optimum ground pattern and avoiding collision. (Author)

A82-13963 # Theoretical analysis of wake-induced parachute collapse. H. R. Spahr and D. F. Wolf (Sandia National Laboratory, Albuquerque, NM). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1922.* 8 p. 16 refs. Research supported by the U.S. Department of Energy.

During recent drop tests of a prototype weapon system, the parachute collapsed soon after it became fully inflated. The magnitude and duration of the collapses were severe enough to degrade parachute performance drastically. A computer-assisted analysis is presented which models parachute inflation, forebody and parachute wake generation, and interaction between the wake and the inflating or collapsing parachute. Comparison of the analysis results with full-scale drop test results shows good agreement for two parachute sizes; both parachutes were tested with and without permanent reefing. Computer-generated graphics (black and white drawings, color slides, and color movies) show the forebody and inflating parachute, the wake, and the wake and parachute interaction. (Author)

A82-13966 # Escape systems decelerator technology. D. N. DeSimone (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). *American Institute of Aeronautics and Astronautics, Aerodynamic Decelerator and Balloon Technology Conference, 7th, San Diego, CA, Oct. 21-23, 1981, Paper 81-1913.* 4 p.

The development of escape system technology is considered, taking into account initial ejection seat concepts during World War II, safe parachute operation following escape from the aircraft, fatality rates among ejectees, and major modification programs during the mid- to late-1960's. Advances in military parachute technology are considered, and technological problems associated with drogue stabilization parachutes are examined. Attention is given to characteristics which are commonly encountered with today's escape system decelerator. There is found to be a need for advancements in the state-of-the-art in escape system decelerator technology. G.R.

A82-13968 * # Modeling procedures for handling qualities evaluation of flexible aircraft. K. S. Govindaraj, B. J. Eulrich, and C. R. Chalk (Calspan Advanced Technology Center, Buffalo, NY). *Institute of Electrical and Electronics Engineers, Annual Allerton Conference on Communication, Control, and Computing, 19th, Monticello, IL, Sept. 30-Oct. 2, 1981, Paper.* 11 p. NASA-supported research; Contract No. F33615-79-C-3618.

This paper presents simplified modeling procedures to evaluate the impact of flexible modes and the unsteady aerodynamic effects on the handling qualities of Supersonic Cruise Aircraft (SCR). The modeling procedures involve obtaining reduced order transfer function models of SCR vehicles, including the important flexible mode responses and unsteady aerodynamic effects, and conversion of the transfer function models to time domain equations for use in simulations. The use of the modeling procedures is illustrated by a simple example. (Author)

A82-13969 * # Aeroelasticity matters - Some reflections on two decades of testing in the NASA Langley Transonic Dynamics Tunnel. W. H. Reed, III (NASA, Langley Research Center, Loads and Aeroelasticity Div., Hampton, VA). *Deutsche Gesellschaft für Luft- und Raumfahrt and Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, International Symposium on Aeroelasticity, Nürnberg, West Germany, Oct. 5-7, 1981, Paper.* 17 p. 47 refs.

In 1955, work was started on the conversion of a subsonic wind tunnel to a 16-foot transonic tunnel with Freon-12 or air as the test medium. The new facility, designated the Transonic Dynamics Tunnel (TDT), became fully operational in 1960. A description is presented of aeroelastic testing and research performed in the TDT since 1960. It is pointed out that wind-tunnel tests of aeroelastic models require specialized experimental techniques seldom found in other types of wind-tunnel studies. Attention is given to model mount systems, launch vehicle models, aircraft models, aircraft buffet, gust response, stability derivative measurements, and subcritical testing techniques. Aspects of vehicle development testing are considered along with aeroelastic 'fixes', aeroelastic 'surprises', approaches for controlling aeroelastic effects, and unsteady pressure measurements. G.R.

A82-13971 * # The development of cryogenic wind tunnels and their application to maneuvering aircraft technology. E. C. Polhamus and R. P. Boyden (NASA, Langley Research Center, Hampton, VA). *NATO, AGARD, Symposium on Combat Aircraft Maneuverability, Florence, Italy, Oct. 5-8, 1981, Paper.* 13 p. 20 refs.

Cryogenic wind tunnels are considered as a means of studying high Reynolds number (Re) complicated flows encountered by high maneuvering lift and high angles of attack characteristic of modern fighter aircraft. Large decreases in the viscous force while the inertial force remains constant are provided by the use of cryogenic facilities. A 2.5 m square tunnel is nearing completion at the National Transonic Facility (NTF), and will be driven by synchronous motors having a total power of 120,000 hp. The tunnel, using N2 as the cryogenic fluid, will allow large Re sweeps at constant dynamic pressure and dynamic pressure, and aeroelastic sweeps at constant Re; full altitude (air density) and acceleration force simulation will also be possible. Advances in model and strain gage balance technologies for use at the NTF are outlined, and experiments with buffet are described. M.S.K.

A82-13972 * # The integration of control and display concepts for improved pilot situational awareness. L. H. Person, Jr. and G. G. Steinmetz (NASA, Langley Research Center, Hampton, VA). *Flight Safety Foundation, International Air Safety Seminar, 34th, Acapulco, Mexico, Nov. 9-12, 1981, Paper.* 18 p.

Consideration is given to a part of the Langley Terminal Configured Vehicle program in which the pilot is retained as an active segment of an integrated system. The pilot is active in the outer control loop and controls the orientation of the aircraft velocity. The pilot thus has a task, but a low workload. Attention is also given to first- and second-generation primary flight display for horizontal and vertical situation awareness. S.C.S.

A82-13973 * # Jet V/STOL wind-tunnel simulation and groundplane effects. R. J. Margason (NASA, Langley Research Center, Subsonic Aerodynamics Branch, Hampton, VA). *NATO, AGARD, Symposium on Fluid Dynamics of Jets with Applications to V/STOL, Lisbon, Portugal, Nov. 2-6, 1981, Paper.* 22 p. 55 refs.

Low-speed wind-tunnel testing of V/STOL aircraft concepts to determine the aerodynamic-propulsion interaction effects during the transition between hover and wingborne flight is a necessary step in the development cycle of this type of aircraft. Powered models are normally used to determine the aerodynamic performance characteristics. This paper examines some of the pretest preparation necessary to define the objectives of an appropriate investigation. Several factors which influence the selection of the model concept and the engine simulator are discussed. In addition, some of the test techniques important for this class of aircraft model are examined. Finally, the paper reviews some of the wind-tunnel wall effects important to this type of aircraft testing with special emphasis on groundplane effects. (Author)

A82-13974 * # Progress in aeronautical research and technology applicable to civil air transports. R. E. Bower (NASA, Langley Research Center, Hampton, VA). *International Meeting on Transportation Research: State of the Art Perspectives and International Cooperation, Amalfy, Italy, Nov. 11-14, 1981, Paper.* 51 p.

Recent progress in the aeronautical research and technology program being conducted by the United States National Aeronautics and Space Administration is discussed. Emphasis is on computational capability, new testing facilities, drag reduction, turbofan and turboprop propulsion, noise, composite materials, active controls, integrated avionics, cockpit displays, flight management, and operating problems. It is shown that this technology is significantly impacting the efficiency of the new civil air transports. The excitement of emerging research promises even greater benefits to future aircraft developments. (Author)

A82-13975 # **Flight vibration optimization via conformal mapping.** F. D. Bartlett, Jr. (U.S. Army, Structures Laboratory, Hampton, VA). *American Helicopter Society, Northeast Region National Specialists' Meeting on Helicopter Vibration: Technology for Jet Smooth Ride, Hartford, CT, Nov. 2-4, 1981, Paper.* 11 p. 7 refs.

An analytical approach based on the principle of conformal transformations is presented for evaluating the effects of structural dynamic changes on flight vibrations. Structural dynamic changes are characterized by discrete and multidimensional impedance adjustments. Discrete impedance changes such as point mass, colinear stiffness, and dynamic absorbers are emphasized to illustrate the practical aspects of the approach for flight vibration optimization. Conformal mapping, through inspections of complex-plane response circles, offers the capability for rapid evaluation of discrete impedance change effects on flight vibrations. The operational equations require only baseline vibration data and impedance change dynamics. Specific criteria for reducing vibrations are established using the response circle equations. In addition, the required impedance change to achieve minimum or zero vibration is uniquely defined. Flight vibration optimization is illustrated using a remote absorber in conjunction with AH-1G helicopter ground and flight vibration measurements. Vibration reduction and absorber performance are assessed at several flight conditions and airframe stations. (Author)

A82-13990 # **A set of finite elements developed for the dynamic computation of composite helicopter blades.** L. Simon (Société Alkan, Valenton, Val-de-Marne; ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(Institution of Mechanical Engineers, National Engineering Laboratory, and Paisley College of Technology, International Conference on Composite Structures, Paisley, Scotland, Sept. 16-18, 1981.) ONERA, TP* no. 1981-87, 1981. 16 p. 10 refs.

The paper proposes the creation of a set of finite elements for the computation of the eigenmodes of a helicopter rotor or airscrew blade made of composite materials in rotation or at rest. Isoparametric thick shell type elements are formulated to obtain degrees of freedom on the blade airfoil skeleton. The stiffness and consistent mass elements are presented to allow the computation of the eigenmodes of the clamped structure at rest, and the convenience of discretizing the terms of the variational formulation is demonstrated. Centrifugal effects giving a centrifugal stiffness element are used to determine the quasi-static equilibrium position, which can then determine the prestress due to spinning effects. Finally, the gyroscopic eigenvalue problem is developed, and numerical results are compared with experimental results for a tilt-rotor blade aeroelastic model. D.L.G.

A82-13992 # **Application of the ONERA dynamic stall model to a helicopter blade in forward flight.** C. T. Tran (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France) and D. Falchero (Société Nationale Industrielle Aérospatiale, Marignane, Bouches-du-Rhône, France). *(Deutsche Gesellschaft für Luft- und Raumfahrt, European Rotorcraft and Powered Lift Aircraft Forum, 7th, Garmisch-Partenkirchen, West Germany, Sept. 8-11, 1981.) ONERA, TP* no. 1981-89, 1981. 26 p. 12 refs.

A single blade analysis for a helicopter rotor in hover and in forward flight is developed, which applies the unsteady aerodynamics of the ONERA two-dimensional dynamic stall model. The stability of the aeroelastic system is studied by means of the Floquet theory, and it is shown that the subharmonic oscillation and almost periodic oscillation of the Floquet modes can readily occur. Periodic responses for the quasi-steady and unsteady calculations are compared, and it is found that while the blade normal lift force distribution is insensitive to unsteady effects, the blade aerodynamic pitching moment and the torsional response are subjected to more influence of the unsteady aerodynamic pitching moment damping and time delay effects. It is concluded that the introduction of the blade flap and lead-leg elastic deformations should present no difficulty in principle by a modal superposition of the blade's normal modes. D.L.G.

A82-13993 # **Development of an MLS lateral autoland system with automatic path definition.** A. A. Lambregts (Boeing Commercial Airplane Co., Seattle, WA). *American Institute of Aeronautics and Astronautics, Guidance and Control Conference, Albuquerque, NM, Aug. 19-21, 1981, Paper 81-1751.* 8 p. 5 refs.

The new Microwave Landing System will provide extended aircraft guidance capability in the terminal area. To utilize this capability effectively requires that the approach path be defined. This paper describes the development and simulator evaluation of an MLS lateral autoland control algorithm, using automatic path definition. The algorithm connects the initial approach path to the extended runway centerline, using straight and constant radius turn segments. The path is executed by a linear track and a novel circular turn control law to capture a straight track using MLS azimuth and DME signals. The algorithm eliminates maneuver transients when switching to MLS guidance and avoids external path definition inputs. (Author)

A82-14042 # **Aircraft absorbers - Promise and practice.** A. O. Andersson (Boeing Commercial Airplane Co., Seattle, WA). *Acoustical Society of America, Meeting, 101st, Ottawa, Canada, May 18-22, 1981, Paper.* 21 p.

Attention is given to the application of sound absorbers to aircraft engine ducts. Fan duct application is discussed with reference to the frequency spectrum of fan noise, the wave number spectrum of fan noise, and both local and extended reactions to lining types. The design of duct linings is examined, noting a number of analysis techniques for non-uniform ducts and linings. The impedence meter is considered for non-destructive testing of curved lining panels, and possibilities for mode measurements for lining design are reviewed. S.C.S.

A82-14043 # **Impedance modeling of acoustic absorbing materials for aircraft engine applications.** L. W. Dean, III (United Technologies Corp., Commercial Products Div., East Hartford, CT) and W. P. Patrick (United Technologies Research Center, East Hartford, CT). *Acoustical Society of America, Meeting, 101st, Ottawa, Canada, May 18-22, 1981, Paper.* 51 p. 65 refs.

A review of conditions under which impedance is a useful concept in solving the problem of wave propagation in a duct with flow is presented with illustrative examples. Organized procedures for modeling single and multiple degree of freedom configurations both of the lumped and distributed parameter type are discussed, and data and model predictions are compared for some specific configurations. Assumptions usually made in the modeling process are pointed out, and the effect of the assumptions, particularly on the comparisons with data, are evaluated. Improved impedance models, developed more recently, are reviewed and compared with previous models and with impedance tube data. Included in the discussion are models for bulk absorber materials compatible with aircraft engine environments. (Author)

A82-14354 **Fighters - Improving the breed.** G. Warwick. *Flight International,* vol. 120, Nov. 7, 1981, p. 1369, 1370, 1374, 1375.

Performance capability gains are projected in light of structural and weapon system modifications to the F-15 and F-16 aircraft. The conversion of the F-16 to the F-16E variant entails the addition of two fuselage plugs that lengthen the fuselage by 56 in., and the bolting on of a double-delta wing having 120% greater area than the present one. Together, these modifications increase internal fuel capacity by 82%, representing 124% greater range for the same payload. Attention is also given the staged development and retrofit of day/night, all-weather air defense and ground attack F-16 electronics. The modifications contemplated for the F-15E two-seat variant include synthetic aperture radar (SAR) and a rear cockpit equipped with CRT displays for radar, forward-looking infrared (FLIR), threat warning, and a computer-generated tactical map. O.C.

A82-14363 **Trim tab excitation system for the BAe 146.** P. Lawson (Cranfield Institute of Technology, Cranfield, Beds., England). *Aircraft Engineering,* vol. 53, Oct. 1981, p. 12.

An account is given of the design of an aileron and elevator trim tab controlled excitation system which would assist in BAe 146 control surface flight clearance trials. For the flutter trials to be valid, it was necessary to devise an excitation system which would fit into wing and tailplane structures without their modification. In order to provide an effective fail safe system against electrical or hydraulic failure, the trim tab centralizing mechanism exceeds the actuator stall load by more than 2:1, which in the case of the elevator requires about 5,000 lbs of axial thrust. The mechanism employed comprises a spring-loaded toggle linkage operating a wedge into the side of the main actuator piston. Bench tests show an adequate system response over the 1-60 Hz frequency range required. O.C.

A82-14364 **The protection of gas turbine blades - A platinum aluminide diffusion coating.** R. G. Wing (Rolls-Royce, Ltd., Leavesden, Herts., England) and I. R. McGill. *Aircraft Engineering,* vol. 53, Oct. 1981, p. 15-21. 17 refs.

The combination of high turbine operating temperatures and the presence of ingested sulphate and chloride salts in the marine environments in which ships, hovercraft and helicopters operate can lead to the costly hot corrosion of turbine blades. A discussion is presented of the use of platinum aluminide coatings to protect super-alloy turbine blades from both oxidation and hot corrosion with greater effectiveness than nickel aluminide diffusion coatings. Because of the problems of poor adherence, high porosity and hardness associated with the use of electroplating in the application of the initial platinum coating to nickel-based super-alloy blades, a fused salt platinum deposition process has been developed. The aluminizing of this base layer is conducted at temperatures below 800 C, yielding a 50-micron platinum aluminide layer of which only the outer two microns are pure, with greater depths containing a beta-nickel aluminum intermetallic. Burner rig test results in which contaminants representative of marine environment conditions are reported for the cases of two coatings produced by the new deposition method, JML-1 and -2. O.C.

A82-14365 **Attack on superalloys by chemical and electrolytic processes.** H. Simon and M. Thoma. *Aircraft Engineering,* vol. 53, Oct. 1981, p. 22-25.

In the course of such turbine aircraft engine production and overhaul surface treatment processes as electrolytic degreasing, chemical and electrochemical etching, chemical descaling and chemical stripping of thermally sprayed coatings, the precipitation-hardened nickel- and cobalt-base alloys of the highest-temperature turbine elements are subjected to corrosion. This effect is due to the carbide, nitride and carbonitride intermetallics formed by alloying elements added for precipitation hardening, which appear as inclusions of various shapes and sizes within the grain or at the grain boundaries. It is shown that these intermetallics, present as separate phases, can be dissolved out by oxidative attack. Backscattered electron and X-ray analyses of seven nickel- and cobalt-base materials lead to the conclusion that certain processes or process steps cannot be employed in production and overhaul, and alternative processing methods are suggested. O.C.

A82-14376 # **Status and tracking system for flight test data products.** R. Large, W. May, and D. O'Keefe (USAF, Flight Test Center, Edwards AFB, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2395*. 13 p.

A flight test data product status and tracking (SANDT) system has been developed and used by the Air Force Flight Test Center. Initially used in support of the Air Launched Cruise Missile Program, the SANDT has recently been applied to F-15 testing. The SANDT makes use of System 2000 Data Base Software on the Center's CDC CYBER 74 scientific computer. The paper will discuss the requirements, design alternatives, resource use, and operating experience to date. Results include improved data support planning, flexibility in supporting dissimilar flight test program, and integration of data processing with status reporting. (Author)

A82-14377 # **An advanced facility for processing aircraft dynamic test data.** D. J. Stouder (Douglas Aircraft Co., Long Beach, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2398*. 10 p.

Capabilities of the Acoustics and Vibration Data Center (AVDC) are described, using examples from various flight and laboratory tests related to commercial and military jet transports. Features such as the one-third-octave-band spectrum analysis and the narrow-band spectrum analysis, which were developed to derive noise intensity and annoyance parameters, are discussed. The paired-signal analysis for studying input-output problems, and audio presentation are also described. In addition, future developments are summarized, including the integration of the AVDC with the main flight-test data processing facility. D.L.G.

A82-14379 * # **Experience with flight test trajectory guidance.** M. R. Swann, E. L. Duke, E. K. Enevoldson, and T. D. Wolf (NASA, Flight Research Center, Edwards, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2504*. 8 p. 5 refs.

A system that provides the test pilot with flight test trajectory guidance is presently evolving at the NASA Dryden Flight Research Facility. In use, this system has resulted in discernible improvements in the ease and accuracy with which pilots have approached and maintained the desired flight test conditions or trajectories. This paper describes the use of the guidance system in several past flight programs at Dryden, including the F-111 TACT program, the F-15 airframe/propulsion system interaction program, the F-15 cone transition and boundary layer experiments, and the Space Shuttle tiles flight test program. (Author)

A82-14380 # **Pave Mover Flight Test Program.** D. E. Holberg and J. F. Grabowsky (Hughes Aircraft Co., Los Angeles, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2482*. 11 p. USAF-DARPA-sponsored research.

Pave Mover is an Advanced Development Model Program performed by Hughes Aircraft Company and sponsored by the Rome Air Development Center and DARPA; it is currently under test at White Sands Missile Range, New Mexico. The system consists of an F-111E aircraft carrying a long range MTI/SAR radar and a ground based data processing and control system connected by a two-way Sperry data link. Pave Mover is the radar portion of the DARPA-conceived Assault Breaker concept demonstration designed to counter a massive attack of tank forces by radar updated surface-to-surface missiles equipped with anti-tank submunitions. During the demonstration it is also intended to track and guide air-to-surface missiles and manned attack aircraft. After a brief system description, the paper discusses flight test aspects, such as aircraft modification, the removable radar/pallet design, simulated targets, remotely controlled tank targets, missile simulation using an F-4 aircraft, the accuracy reference instrumentation, and various software simulators used in preparation for the tests. (Author)

A82-14381 * # **In-flight deflection measurement of the HiMAT aeroelastically tailored wing.** V. M. DeAngelis (NASA, Ames Research Center, Edwards, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2450*. 11 p.

An electro-optical flight deflection measurement system was developed for NASA for use on the highly maneuverable aircraft technology (HiMAT) remotely piloted research vehicle (RPRV) to provide a means of evaluating the performance of the HiMAT's aeroelastically tailored composite wing and canard. A description of the flight deflection measurement system is presented from a user's viewpoint and includes the general method of operation, system capabilities and limitations, method of installation on the HiMAT vehicle, and calibration of targets. Also included is a general description of the HiMAT RPRV and its design goals. Preliminary flight deflection and bending moment data were obtained at Mach 0.8 and were extrapolated to the Mach 0.9 maneuver design condition for comparison to NASTRAN predictions and ground loads test results. The preliminary flight test results tended to agree with the results obtained from the static ground loads tests, that is, that the NASTRAN model overpredicted the streamwise twist of the composite outer wing panel. (Author)

A82-14382 * # **A review of flight-to-wind tunnel drag correlation.** E. J. Saltzman and T. G. Ayers (NASA, Flight Research Center, Edwards, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2475*. 19 p. 46 refs.

Comparisons are made of wind-tunnel-model and flight drag data for various configurations representing aircraft from the mid-1940s to the 1970s. Discrepancies between model and flight data such as Reynolds number effects, wall interference, and aeroelastic problems are discussed. String support effects and the inability of models to simulate surface deflections for longitudinal trim are also studied. A wind tunnel-to-flight correlation of turbulent friction drag confirms the incompressible Karman-Schoenherr variation of turbulent skin friction with Reynolds number and the T' method for accounting compressibility effects. NASA tested 10 deg cone research indicates that model tests which are affected by tunnel noise may require the lower disturbance level environment available in flight, and it is concluded that new cryogenic facilities will improve the fidelity of model simulations of full-scale flight flow phenomena. D.L.G.

A82-14383 * # **Techniques for modifying airfoils and fairings on aircraft using foam and fiberglass.** M. B. Meyer (NASA, Flight Research Center, Edwards, CA) and F. Jiran (Fred Jiran Glider Repairs, Mojave, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2445.* 15 p. 5 refs.

The concept of using foam and fiberglass reinforced plastic to modify airfoils and fairings was applied successfully to high-speed aircraft at NASA Dryden Flight Research Center. An on-aircraft installation method was used to modify an F-15 wing glove and wing leading edge and an F-104 flap trailing edge in support of the Shuttle tile airload tests. A combination of methods, both an on-aircraft installation and an off-aircraft fabrication for installation on the aircraft, was used to modify a section of an F-111 supercritical wing with a natural laminar flow airfoil. Techniques, methods, problem areas, and recommendations are presented which indicate that using foam and fiberglass to modify airfoils and fairings on high-speed aircraft is a viable means of quickly developing airfoils and fairings with desired aerodynamic characteristics with little risk to the parent or carrier aircraft. (Author)

A82-14384 # **KC-10, flight test program management - The contractor's viewpoint.** J. L. Cook (Douglas Aircraft Co., Long Beach, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2380.* 4 p.

The management of a flight test program for the KC-10 aerial refueling tanker aircraft, which included elements of development, FAA certification and Air Force qualification and operational testing, is described. In addition to the manufacturer and the FAA, the participants included the Joint AFLC/AFCS Program Office (JPO), the Air Force Primary Test Organization, and the Air Force Test and Evaluation Center. The flight test program involved not only tanker and receiver aircraft qualifications and operational evaluations, but also air crew training, ground crew training, tech order validation, maintainability demonstrations, human factors tests, support equipment compatibility validations, cargo loading demonstrations, and acceptance test procedure validations. It was found that a division of authority between the Air Force and the FAA was highly effective, and that parallel, rather than series development testing is essential to efficient test programs. O.C.

A82-14385 # **62% manned aircraft demonstrator - Next generation trainer.** W. H. Shawler (Fairchild Republic Co., Farmingdale, NY). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2519.* 8 p.

A manned, 62% scale aircraft demonstrator designed for the Air Force's next generation trainer program is reported. Areas investigated include basic handling qualities, hinge moments on the flight control surfaces, vertical and horizontal tail loads, and spin characteristics. Results of the program are compared with wind tunnel results and scaling effects, and show good agreement with the previous data for features such as flap lift increment, aileron and rudder effectiveness, and the maximum lift coefficient. It is concluded that the 62% scale flight tests are accurate, and the concept can be used for new programs such as the NGT at a greatly reduced cost. D.L.G.

A82-14386 # **Hover tests of the XV-15 Tilt Rotor Research Aircraft.** M. D. Maisel (U.S. Army, Research and Technology Laboratories, Moffett Field, CA) and D. J. Harris (U.S. Navy, Naval Air Test Center, Patuxent River, MD). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2501.* 13 p. 5 refs.

A series of tests was conducted to investigate the hovering characteristics of the XV-15 Tilt Rotor Research Aircraft. Various wheel heights were flown to examine the effects of ground proximity. In addition to free hover, the aircraft was operated on a tie-down facility that provided a 1.8-m (6-ft) wheel-height condition. Data were obtained for hover performance both in and out of ground effect, downwash phenomena, handling characteristics as a function of hover height, and acoustics around the hovering aircraft. The results show that the XV-15 is efficient in hover and that increased control activity is required as the aircraft approaches the ground. Downwash velocities are moderate at the sides of the aircraft and relatively high fore and aft. The acoustics evaluation revealed moderate noise levels with an acceptable sound quality. (Author)

A82-14387 # **Testing capabilities of the 3246th Test Wing.** D. H. Williams, Jr. (USAF, Eglin AFB, FL). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2484.* 7 p.

The capabilities of the 3246th Test Wing at Eglin Air Force Base are reviewed, and developmental non-nuclear air armament systems and components are evaluated. The Wing's geographic location with respect to major population centers, current testing capabilities, existing instrumentation facilities, and plans for expanding the air-to-surface, air-to-air and electromagnetic capabilities are discussed. Typical missions using the multiobject tracking, ranging and control system are presented, and the seeker evaluation test system and the preflight integration of munitions and electronics systems are reported. Other future programs are discussed, which include increasingly sophisticated all-weather weapons with significantly improved multiple kill per pass hit probabilities. D.L.G.

A82-14389 # **Integrated flight testing based on nonlinear system identification data processing techniques.** J. H. Vincent and S. N. Franklin (Systems Control Technology, Inc., Palo Alto, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2449.* 11 p. 7 refs. Contract No. N00014-78-C-0641.

The results presented in this paper demonstrate the operational status of nonlinear system identification data processing techniques. Aerodynamic, installed thrust, and flight test instrumentation calibration models are identified for the F-4S from six different flight conditions which encompass a large range in angle of attack, sideslip, airspeed, control inputs, and body rotation rates. The capability for identifying nonlinear aerodynamic models in a format compatible with preflight predictions is demonstrated. A methodology for determining the accuracy of the parameters estimates is presented. (Author)

A82-14390 * # **AD-1 oblique wing aircraft program.** T. C. McMurtry, A. G. Sim, and W. H. Andrews (NASA, Flight Research Center, Edwards, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2354.* 7 p.

A NASA program for evaluation of the handling and flying characteristics of the AD-1 oblique wing aircraft is discussed. The vehicle was flown to compare wind tunnel predictions with aerodynamic data, explore the control system requirements, and obtain a preliminary assessment of the aeroelastic effects. The fiberglass sandwich skin aircraft is designed for 8 g positive and 4 g negative loading at 175 knots, while the wing pivot can withstand 25 g loading. Flight monitoring was accomplished with a 41 channel pulse code modulation system for telemetry and by averaging of pilot ratings. Maneuvering tests are outlined, noting that pilot ratings indicated acceptable handling at up to 50 deg sweep. It is concluded that acceptable flying qualities can be achieved with a 60 deg sweep, and that aeroelastic tailoring can be used to satisfy cruise design technology. M.S.K.

A82-14392 * # **The use of frequency methods in rotorcraft system identification.** R. W. DuVal (NASA, Ames Research Center, Moffett Field, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981,* *AIAA Paper 81-2386.* 9 p.

A new approach to model structure determination is examined. Flight data from the Rotor Systems Research Aircraft (RSRA) are transformed into the frequency domain and truncated to provide band limiting. The stepwise regression technique is then used to identify a quasistatic state-space model from the transformed data. The data processing requirements for both time domain and frequency domain identification are discussed and the results of the two techniques are compared. (Author)

A82-14393 * # **Comparison of wind tunnel and theoretical aeroelastic predictions with flight measured airloads for the B-1 aircraft.** R. L. Sims and A. L. Carter (NASA, Flight Research Center, Edwards, CA). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2387.* 15 p. 13 refs.

An aeroelastic analysis of the B-1 aircraft was generated using the FLEXSTAB computer program. Relatively simple aerodynamic and structural models were employed. Theoretical wing and horizontal stabilizer airloads were compared to wind tunnel predictions and flight data measured during quasi-steady pitch maneuvers at Mach numbers of 0.85 and 1.2 with the wing in the 67.5 degree full aft sweep position. The basic objective was to evaluate the usefulness of the FLEXSTAB program for pre-flight airloads analysis of large flexible aircraft. Significant aeroelastic increments were noted between rigid and flexible vehicle results. FLEXSTAB predicted airloads for the outer wing panel were in good agreement with measured data for both rigid airloads and elastic increments. FLEXSTAB results for the horizontal stabilizer were useful for defining general aeroelastic trends, but absolute load levels were not well predicted due to theoretical limitations and difficulties encountered in modelling the complex B-1 configuration. Overall, the FLEXSTAB program is viewed as a useful integrated tool for static aeroelastic analysis in support of flight programs. (Author)

A82-14398 # **Advanced fighter technology integration AFTI/F-16 test program overview.** R. A. Gill and C. L. Saint Sauver (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). *AIAA, SETP, SFTE, SAE, ITEA, and IEEE, Flight Testing Conference, 1st, Las Vegas, NV, Nov. 11-13, 1981, AIAA Paper 81-2353.* 17 p.

The AFTI/F-16 Advanced Development Program objective is to develop, integrate, and validate advanced fighter technologies to improve air-to-air and air-to-surface weapon delivery and survivability. The technologies include a Digital Flight Control System, Integrated Flight/Fire Control, pilot/vehicle interface advancements, and advanced flight control modes through direct force control and weapon line pointing. Extensive modifications were made to an F-16A for installation of a data instrumentation system, modified inlet with canards, and a dorsal fairing. The AFTI/F-16 is undergoing an extensive test program to provide the confidence necessary to transition the new technologies for retrofit into existing aircraft or incorporation into new fighter aircraft designs. (Author)

A82-14407 * **Development of a comprehensive analysis for rotorcraft. II - Aircraft model, solution procedure and applications.** W. Johnson (NASA, Ames Research Center; U.S. Army, Aeromechanics Laboratory, Moffett Field, CA). *Vertica,* vol. 5, no. 3, 1981, p. 185-216. 15 refs.

The development of a comprehensive analytical model of rotorcraft aerodynamics and dynamics is described. Particular emphasis is given to describing the reasons behind the choices and decisions involved in constructing the model. The analysis is designed to calculate rotor performance, loads and noise; helicopter vibration and gust response; flight dynamics and handling qualities; and system aeroelastic stability. It is intended for use in the design, testing and evaluation of a wide class of rotors and rotorcraft and to be the basis for further development of rotary wing theories. The general characteristics of the geometric, structural, inertial and aerodynamic models used for the rotorcraft components are described, including the assumptions introduced by the chosen models and the resulting capabilities and limitations. Finally, some examples from recent applications of the analysis are given. (Author)

A82-14414 **The operational characteristics of turbojets, giving particular attention to the cooled high-pressure turbine (Zum Betriebsverhalten von Turboluftstrahlantrieben unter besonderer Berücksichtigung der gekühlten Hochdruckturbine).** W. Muggli (München, Technische Universität, Munich, West Germany). *Zeitschrift für Flugwissenschaften und Weltraumforschung,* vol. 5, Sept.-Oct. 1981, p. 273-283. 6 refs. In German.

The employment of a gas turbine has great advantages for aircraft, provided high operational temperatures and pressures can be used. In connection with the current status of technology concerning materials, it is necessary to cool engine components exposed to the hot gases. The consideration of the cooling processes is an importont factor in the determination of the operational characteristics of a turbojet. The computation of the local flow conditions in the blading area of a turbomachine is considered and a description is presented of the computational procedures for determining the amount of heat transferred at a cooled blade of the turbine. The determination of the amount of air needed for cooling is discussed along with the numerical calculation of the operational characteristics of cooled axial turbines. Attention is given to a number of approaches for reducing the amount of air required for cooling in a high-pressure turbine. G.R.

A82-14416 **Wing design for light transport aircraft with improved fuel economy.** D. Welte, R. Birrenbach, and W. Haberland (Dornier GmbH, Friedrichshafen, West Germany). *Zeitschrift für Flugwissenschaften und Weltraumforschung,* vol. 5, Sept.-Oct. 1981, p. 294-303. 5 refs. Research supported by the Bundesministerium für Forschung und Technologie.

Investigations related to the development of a new wing for a light transport aircraft were initiated by a German aerospace company in 1975. Flight tests for the evaluation of the new wing began in June 1979. The considered design incorporates a new wing section and a wing tip having a triangular shape. The induced drag observed in connection with the new wing tip is less than the corresponding value found for wing tips of conventional design. Tradeoff studies were conducted to optimize wing area and wing aspect ratio for the specified performance requirements. A use of the new wing design makes it possible to obtain aircraft with high maximum-lift values, low drag, and good stall characteristics. Attention is given to the wing parameter study, aspects of airfoil design, the flap design, the wing design, the aileron, and the merits of a number of different wing structures. G.R.

A82-14418 **The load-carrying behavior of a trapezoidal aluminum-alloy supporting element, subjected to a compressive stress, in the postbuckling region (Das Tragverhalten eines gedrückten Alu-Trapezträgers im Nachbeulbereich).** E. Schneider (Vereinigte Flugtechnische Werke GmbH, Bremen, West Germany). *Zeitschrift für Flugwissenschaften und Weltraumforschung,* vol. 5, Sept.-Oct. 1981, p. 313-323. 8 refs. In German. Research supported by the Bundesministerium der Verteidigung.

An analysis is conducted of the behavior of a trapezoidal aluminum-alloy supporting element which is subjected to a compressive force, taking into consideration before and after the force reaches the value of the carrying capacity. The analysis makes use of the finite-element method, and takes into account geometrical nonlinearities and the elastic-plastic material characteristics of aluminum. It is found that the behavior of the supporting element in the postbuckling region can be determined with the aid of the slow ramp method, a dynamic computational procedure. The magnitude of the considered system damping and the deformation rate selected for the computation are found to have a significant effect on the result. A comparison of computed and experimental data shows that it is possible to predict the behavior of the supporting element analytically with satisfactory accuracy. G.R.

A82-14676 **NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volumes 1, 2 & 3.** Conference sponsored by the Institute of Electrical and Electronics Engineers. New York, Institute of Electrical and Electronics Engineers, Inc., 1981. Vol. 1, 460 p.; vol. 2, 495 p.; vol. 3, 502 p. Price of three volumes, members, $45.; nonmembers, $60.

Topics of aerospace electronics such as the ADA programming language, inertial systems, microcomputer applications, survivability, and the all-electric aircraft were discussed. Papers were presented on laser gyros and advanced navigation systems, as well as advanced architecture, communications, and radar equipment, software, and avionics and armament planning. Failures in high voltage tubes were considered, and attention was given to signal processing techniques, integrated aircraft controls, fire control, software support tools, cost estimates for software, and medical technology. Emphases were placed on Kalman filter, an electronic terrain map, EM compatibility, aerospace power systems, air traffic control, environmental stress measurements, fault isolation, and multivariable flight control design. M.S.K.

A82-14678 **The design and implementation of a canned scenario function for the F-16 dynamic system simulator.** L. Gearhart (Lear Siegler, Inc., Astronics Div., Dayton, OH) and D. L. Dresel (TRW Defense and Space Systems Group, Dayton, OH). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 10-17.

The F-16 Dynamic System Simulator (DSS) is an integrated hardware and software system used to test the F-16 Operational Flight Program (OFP). A major function of DSS is its Canned Scenario, the generation of repeatable scenarios for demonstrations and for the verification and validation of the F-16 OFP. Development of a canned scenario requires the classification of the dynamic characteristics of the system: the inputs, outputs, plant and system states. Analysis of the system being simulated is paralleled by an analysis of the simulation models. The interfaces and models are grouped in blocks according to such characteristics as random or asynchronous versus deterministic behavior. An appropriate set of inputs and initial states is defined for the canned scenario function, based on the user's needs. These initial and input variable sets are incorporated into the software design of the canned scenario, and can be recorded and played back in order to repeat the essential behavior of the system. The scenario is applied to the F-16 OFP as an example, and problems encountered in its implementation are discussed. J.F.

A82-14682 **Strapdown inertial reference systems performance analysis.** G. J. Robinette (USAF, Avionics Laboratory, Wright-Patterson AFB, OH), R. C. Burns, and R. M. Schwarz (McDonnell Aircraft Co., Avionics Engineering Div., St. Louis, MO). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 38-45. 7 refs.

The Strapdown Performance Study (SPS) program is being sponsored by the Air Force Wright Aeronautical Laboratories to determine where improvements in strapdown inertial technology are required to meet the tactical and strategic, navigation and weapon delivery requirements associated with advanced tactical fighters (ATF) and advanced cruise missiles (ACM) of the 1990's. Phase I of this study includes the gathering of data, the development of simulation tools, and the methodology for validation of these tools. Data were gathered on current inertial instruments and systems, fundamental performance limitations, and projected instrument capabilities. Mission profiles for the ATF and ACM are used as the basis for establishing performance goals. Strapdown inertial system implementation data were used to establish a preliminary inertial system error budget consistent with ATF/ACM performance goals. A SIMulated Strapdown Inertial Navigation (SIMSIN) computer program, its development, and seven-step validation process are described. J.F.

A82-14684 **A failure detection and isolation system for tactical aircraft with separated IMUs.** P. Motyka (Charles Stark Draper Laboratory, Inc., Cambridge, MA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 51-60. 7 refs. Contract No. F33615-78-C-1563.

The development and evaluation of a failure-detection and isolation (FDI) system for tactical aircraft with two physically separated inertial measurement units (IMUs) are described. Each IMU consists of four inertial instruments in a symmetrical conical array. The instrument outputs are used for both navigation and flight control, reflecting the underlying multifunction inertial reference assembly concept. FID is performed using the generalized likelihood test, and the thresholds required for FDI are defined. Digital simulation results are presented which show the operation of the FDI system over a spectrum of sensor failures and indicate the effects of these failures on navigation errors. Results show that it may be feasible to detect and isolate only the first three failures of the dual IMU system. Lever-arm compensation results in the faster detection of accelerometer failures at the expense of increased computer throughput. Finally, failures of a magnitude less than the soft-failure-detection threshold are more likely to be isolated incorrectly. J.F.

A82-14685 **A concept for a high-accuracy, low-cost accelerometer.** S. G. Shutt (Rockwell International Corp., Autonetics Div., Anaheim, CA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 61-69.

A three-axis accelerometer is described in which low cross coupling between axes is achieved by a novel electromagnetic forcing system. A mechanical proof-mass support system is used, which has small bias variation in the presence of large parts instabilities, compared to the usual inertial instruments. This accelerometer concept has the potential for low-cost and high-accuracy operation over a wide temperature range. An experimental accelerometer was designed, built, and tested to determine the feasibility of the accelerometer concept. The main components of this accelerometer are described first: (1) housing and magnet assembly, (2) proof-mass assembly, (3) pickoff assembly, and (4) filament support system. Data were obtained for the spring rates, the bias and scale-factor coupling coefficients, the bias instability, and the bias temperature sensitivity. All measured parameters were within acceptable calculated values; overall operation of the experimental accelerometer was found to be successful. J.F.

A82-14694 **High-accuracy ranging over voice radios for downed aircrew rescue.** R. H. Brader (RCA, Government Communications Systems Div., Camden, NJ). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 128-133.

A high accuracy ranging technique using digital technology and LSI implementation has transformed a conventional military survival walkie-talkie into a position location system that helps rescue downed pilots. This paper first describes the operational requirements and scenario for a military downed-aircrew rescue. The basic technique involved in a half-duplex ranging system and the specific techniques developed to meet the operational requirements and voice radio constraints are then discussed in some detail. The problems discussed are efficient modulations in an AM radio, delay variation control, rapid acquisition using a narrow bandwidth radio, memory requirements for half-duplex operation and digital design for miniaturization. (Author)

A82-14696 **High speed microwave phase-locked loops.** E. M. Perdue (Raytheon Communication Systems Laboratory, Sudbury, MA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 140-145. 9 refs. Research sponsored by the Raytheon Co.; Contracts No. F33615-73-C-4036; No. F33615-78-C-1583.

A microwave synthesizer scheme is developed, which can embody rapid broadband tuning, accuracy and resolution for instituting Doppler correction, spectral purity for low data rate transmission, remote control, and small size for airborne operations. The scheme is directly adaptable to any band of communication, while providing secure antijamming techniques, and the microwave phase-locked loop can control and produce an output with excellent phase noise characteristics, with spurious levels below -60 dBc at any point in the band. The phase-locked synthesizer also meets present switching speed requirements. D.L.G.

A82-14705 **Electromechanical actuation development program.** S. A. Rowe (AiResearch Manufacturing Company of California, Torrance, CA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 206-213. 12 refs.

A prototype electromechanical actuation system (EMAS) development program for aircraft flight control systems (FCS) was initiated in February 1976, resulting in a working prototype actuation system suitable for aircraft primary FCS applications. Tests involving EMAS components, performance, environment and control/stability are reported, and program motivation, EMAS description and nomenclature, program history, and future objectives are discussed. D.L.G.

A82-14707 **Will power-by-wire replace power-by-hydraulics.** I. S. Mehdi (Boeing Military Airplane Co., Seattle, WA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 221-228. 8 refs.

The development of two parallel aircraft actuation and secondary power systems designed within the context of a two-engined fighter is discussed. One is based on engine-extracted hydraulic power while the other is based on engine-extracted electric power. Consideration is given to actuation system requirements, gun and environmental control system requirements, secondary power system requirements, and temperature parameters. Preliminary results are presented for estimates of weights and life cycle costs for each system. Factors important for achieving an all-electric airplane are identified. S.C.S.

A82-14709 **The all electric airplane - Its development and logistic support.** M. J. Cronin (Lockheed-California Co., Burbank, CA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 241-247. 19 refs.

Developmental and logistic support aspects that must be considered as a part of the development-cycle of potentially large electric power systems are reviewed. Increasing fuel problems and their impact on the economic viability of commercial airlines are discussed. The hardware design, power generation system, environmental control system, and the engine starting system are also discussed. In addition, the impact of these large electric power systems on ground logistic support and operation from ground power units, auxiliary power units, and fixed-plant installations is considered. D.L.G.

A82-14710 **New all-electric-system technology.** C. W. Clay (Boeing Commercial Airplane Co., Seattle, WA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 248-254.

The status of electromechanical actuators (EMA) as a key element in the development of an all-electric aircraft system is investigated. It is found that the feasibility of EMA hardware has been amply demonstrated in laboratory systems and an EMA for a research aircraft. Attention is also given to a distributed data bus communication system, a distributed dc power system, questions of overall system integration, and the design of a flight deck. The reported evaluation study shows that hardware for a complete, fly-by-wire, all-electric aircraft system is either available or will approach production readiness within a year or so. A program to integrate this hardware into a comprehensive single system is highly desirable to enhance development as well as optimize cost and weight benefits. G.R.

A82-14711 **Weapon delivery system using GPS.** A. K. Aggarwal. In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 258-267.

It is pointed out that in a highly dynamic vehicle, such as a fighter aircraft, the GPS User Set is augmented by an Inertial Measurement Unit (IMU) to maintain weapon delivery accuracy during high acceleration maneuvers. This GPS Weapon Delivery System furnishes highly accurate placement of air-to-ground weapons. The system uses a digital computer for computing the automatic release signal in conjunction with an Inertial Measurement Unit and a GPS User Set. The integrated Weapon Delivery System will work together with a Horizontal Situation Indicator, a Vertical Gyro Indicator and/or a Vertical Display Indicator for displaying pilot aiming information. C.R.

A82-14712 **Updated station deselection procedures to support automatic Omega receiver operation.** R. D. Healy, R. R. Gupta (Analytic Sciences Corp., Reading, MA), and P. B. Morris (U.S. Coast Guard, Washington, DC). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 268-273. 10 refs.

Many automatic Omega receivers use a station selection criterion which does not employ specific propagation-related tests designed to avoid errors caused by wrong-way paths and westerly signal traverse of the magnetic equator. These errors can introduce navigationally significant errors into the Omega position solution, which can, however, be minimized by using the manual station deselection feature of the receiver. This paper describes these potential error sources and presents an updated Omega station selection chart containing specific recommendations for station deselection in a number of worldwide locations. A simple test for detecting wrong-way path propagation is also included. (Author)

A82-14713 **Navigation for helicopters by multiple use of inertial sensors.** V. Held (Elektronik-System-Gesellschaft mbH, Munich, West Germany). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 274-282.

The paper presents a concept for the inertial functions - flight control, sight-stabilization, navigation - of a helicopter. A minimum number of dislocated inertial sensors is proposed. The systems functions are accomplished on a system level by multiple use of the sensor signals. It will be proven that attitude and heading can be derived from the flight control and stabilization hardware, so that the usually required attitude and heading reference for the navigation is saved. Moreover, the proposed concept provides as an additional function the autonomous initial alignment to north. (Author)

A82-14719 **Distributed Time Division Multiple Access /DTDMA/ - A distributed signaling technique for advanced tactical communications.** J. Rubin (ITT, ITT Avionics Div., Nutley, NJ). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 332-337. 7 refs. Research supported by ITT.

The Distributed TDMA concept, based on the premise of maximizing the full utility of time, frequency, and code, is described. This multidimensional approach contributes simultaneously to efficient multiple access, antijamming, and low probability of exploitation (LPE) system solutions. The multiple access problem is solved through pseudo-random time and frequency hopping, coupled with interleaved channelization which utilizes low duty signal structures. This random access technique is particularly suited to a Command Control Communication/integrated communication-navigation-identification system as it provides intra-system and related function interference rejections. C.R.

A82-14720 # **Future directions in CNI integrated avionics.** R. L. Harris (USAF, Avionics Laboratory, Wright-Patterson AFB, OH). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics

Engineers, Inc., 1981, p. 338-344. 21 refs.

In order to appropriately satisfy the expected communications, navigation, and identification (CNI) requirements for tactical aircraft of the 1990's, the estimates of volume, weight, and cost of these functions must somehow be reduced. It is noted that the Air Force and Navy's technology programs for integrated CNI concepts have outlined baselines of current integratable hardware, including the functions of HF, UHF, JTIDS, GPS, SEEK TALK, and IFF interrogator/transponder; the programs have also formulated architectures for future development. Among the developing technologies that affect integrated CNI are very large scale integration (VLSI), very high speed integrated circuits (VHSIC); the future programming language Ada; and the development of charge coupled devices (CCD's), surface acoustic wave (SAW) devices, magnetostatic wave (MSW) devices, and microprocessing. The effects on integration are found to be significant. C.R.

A82-14721 # **A modular multiplexed digital voice intercommunications system.** R. F. Bolt and J. J. Seal (U.S. Navy, Naval Avionics Center, Indianapolis, IN). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 345-349. 7 refs.

The design and development of a modular multiplexed digital voice Intercommunications System (ICS) for military applications is described. This system, under development at the Naval Avionics Center, uses a dedicated MIL-STD-1553B multiplexed data bus; its modular design consists of Weapon Replaceable Assemblies (WRAs). The system architecture will provide integrated radio control using a single data bus that carries both digital voice data and control information. This ICS can be configured for a particular aircraft by arranging the various subsystem WRAs to satisfy the weapon system requirements. This paper discusses the functional requirements of the WRAs in the digital voice ICS. System concepts have been demonstrated in the three-station Multiplexed Digital Voice ICS. This breadboard system provides ten bit-rate/audio bandwidth combinations which have been evaluated for intelligibility in three aircraft acoustic noise environments. The intelligibility test results and the results of a package configuration study are summarized. (Author)

A82-14723 **Detection range analysis of an airborne medium PRF radar.** M. B. Ringel (Westinghouse Electric Corp., Baltimore, MD). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 358-362. 10 refs.

The detection range of an air-to-air medium PRF radar is analyzed in terms of the signal processing involved in multiple PRF ranging, the nature of the ground clutter in the range Doppler space defined by such a radar, and the radar/target kinematics. References containing prerequisite knowledge and similar analysis for other types of radars are cited, and the analysis in this paper is compared to previous works. A flow chart of a computer program implementing the analysis outlined in this paper is presented. (Author)

A82-14725 **Using phased array radar for data communications.** H. D. Lewis (RCA, Government Systems Div., Moorestown, NJ). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 371-376.

The idea of using a multifunction array radar at the controlling master station for the additional function of data transmission and reception is introduced. Here, cooperating stations, equipped with suitable transponders, are beacon tracked by the radar, providing positive identification of each station as well as highly accurate positional data for the cooperating stations. Among the applications of this system are surface-to-air command and control, long-range targeting and track from air-to-surface, and surface-to-surface coordination, including both monostatic and multistatic operations. It is pointed out that the high power aperture product and low antenna sidelobes of the phased array radar are inherent characteristics that can be used in combatting ECM. What is more, the ability of multifunction phased array radar to revisit the cooperating station as often as required permits a reliable interchange of data on an interrogation/rely basis. C.R.

A82-14735 **Computational considerations for fusion in target identification systems.** E. L. Waltz (Bendix Corp., Communications Div., Ann Arbor, MI). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 492-497. 29 refs.

This paper presents an overview of the computational implications of applying multisensor data to the target identification problem. Recent efforts to develop a mathematical basis for multisensor correlation (fusion) have been performed by the services and have been directed at local (autonomous) and regional (netted) systems for a wide range of applications. These studies have developed algorithms for ASW, air-air identification, battlefield management, ocean surveillance and air defense. An overview of these 'fusion algorithms' and their relationship to classical pattern recognition is presented. The hierarchical aspects of correlation, combination and aggregation are described and their effects on system complexity are discussed. Key parameters, which characterize the general fusion system, are described and related to processing requirements. These computational requirements are compared to expected VHSIC/VLSI capabilities to project the potential for integrated fusion processing in advanced avionics and weapons systems. (Author)

A82-14739 **Evaluating sources of error in EAR/GEANS navigation using a Kalman postprocessor.** S. H. Musick (USAF, Avionics Laboratory, Wright-Patterson AFB, OH) and N. A. Carlson (Intermetrics, Inc., Cambridge, MA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 520-526. 9 refs.

EAR/GEANS is an integrated radar/inertial system consisting of a coherent multimode radar, EAR, and an accurate inertial navigation unit, GEANS. The EAR radar makes velocity and position measurements that aid GEANS while GEANS in turn supplies EAR with navigation data for measurement control and motion compensation. In this complex system many error sources affect navigation performance. This paper describes an effort to evaluate flight test navigation performance in terms of fundamental sensor error sources. The various models and tools that were developed are discussed. The key tool is a high-order Kalman filter, called the Error Isolation Filter, used as a postprocessor of flight-recorded data. Simulated flight test results are presented to demonstrate error recovery performance. Performance of the EIF using actual flight data is discussed. The paper emphasizes the experiential aspects of the effort. (Author)

A82-14740 **The use of observers on relaxed static stability aircraft.** R. H. Rooney and E. Y. Shapiro (Lockheed-California Co., Burbank, CA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 527-533.

An observer is a dynamical system that reconstructs the states of a system that is used to drive it. Observers can be used when a normally available signal is unavailable due to sensor failure, or as a sensor replacement when the use of a sensor may be undesirable due to operational considerations. The signal provided by the observer can then be used as an input to a controller for various purposes such as stabilization, optimization, or decoupling. The fundamentals of observer design are reviewed and simulation results of observers implemented on Relaxed Static Stability (RSS) aircraft are presented. It is shown that while performance of observers in a RSS aircraft setting is degraded somewhat, their use in unstable applications is not precluded. (Author)

A82-14741 **Integrated Flight/Weapon Control design and evaluation.** W. J. Murphy (McDonnell Aircraft Co., St. Louis, MO) and W. L. Young, Jr. (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). In: NAECON 1981; Proceedings of the

National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 536-543. Contract No. F33615-79-C-3604.

The Integrated Flight/Weapon Control (IFWC) program is aimed at developing integrated flight/fire control technology. This includes increasing weapon delivery capabilities, survivability, and operability in the delivery of guided weapons and dispenser munitions. The completed development of selected concepts through preliminary design is presented; pilot-in-the-loop simulation was used for concept refinement and validation. The preliminary results, based on pilot evaluation, showed that the tactical munitions dispenser weapon delivery system is accurate and provides increased survivability over conventional delivery. The air-to-surface missile delivery system was also found to be good, especially in clear daylight conditions. The most favorably received feature of the IFWC air-to-air weapon delivery system was IFFC-I/FIREFLY III gunnery, which had increased all-aspect gun opportunities in precision pointing, near head-on, long-range opportunities, and high angle-off opportunities. J.F.

A82-14742 **Software considerations in the design of computer generated flight displays.** M. Miller (HRB Singer, Inc., State College, PA) and A. J. Aretz (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 544-548.

The use of formats which take advantage of color imagery and the capabilities of a digital computer is one way of presenting information to pilots that is clearly understandable and requires little interpretation. The functional requirements of four specific graphic presentations and their impact on the design of the display generation software are discussed. The four formats considered are (1) the tactical situation format, (2) the stores status format, (3) the head-up display format, and (4) the integrated flight path format. Due to the dynamic nature of the aircraft, the formats are also required to be dynamic, with a minimum update rate of 5 Hz. Attempts to simulate flight and generate the integrated flight path format have achieved an update rate of 2 Hz. Generating color pictures with computer graphics is essentially a paint-by-number exercise, where color assignment is determined from a VLT. J.F.

A82-14743 # **The influence of smart computers on the cockpit of the future.** N. L. Gravely and J. O. Mysing (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 549-556. 7 refs.

Recent developments in digital technology at the Air Force Wright Aeronautical Laboratories are presented, which will have great impact on the cockpit of the future. Characteristics of the Digital Avionics Information System, representative of the state-of-the-art in cockpit technology, are first discussed. Future capabilities to be achieved by artificial intelligence are then outlined: flexible cockpit reconfiguration, crew decisions aided by computerized systems consultant, machines that understand and converse in free text, and computer vision that can interpret sensor images. A very high speed integrated circuitry (VHSIC) is being developed, which would extend and refine the metal-oxide-semiconductor and bipolar technology to increase through-put rates and improve reliability, while decreasing size and power consumption. Compared to the present F-16 computer, the VHSIC would provide a 90% reduction in size, volume, and weight, an 85% decrease in power, and a 100% increase in MTBF. An intelligent software program (modification of MYCIN /Bernhard, 1980/) is being considered, which would aid the pilot during in-flight system failures. Subsystem developments in the areas of graphics and computer generated imagery, dynamic pictorial displays, image processing, and aircraft emergency procedures are also discussed. J.F.

A82-14744 **A methodology for missile launch envelope display evaluation.** G. E. Corrick (Hughes Aircraft Co., Culver City, CA) and P. V. Kulwicki (USAF, Aerospace Medical Research Laboratory, Wright-Patterson AFB, OH). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 557-564. Contract No. F33615-79-C-0508.

A methodology for objective evaluation of advanced display formats is described. A computer generated, manned, non-interactive single-target air combat simulation was used to evaluate two advanced VSD (vertical situation display) and HUD formats with respect to current F-15 air combat displays. The principal performance measures obtained were pilot responses to questions about the simulated engagement and a measure of the cognitive workload imposed by the format, assessed by the Sternberg reserve capacity task. The pilots comments and opinions were also obtained in a post-evaluation debriefing. Nine operational Air Force pilots were subjects. Results showed no large differences in performance on mission questions across formats, but large differences in imposed cognitive workload. All HUD formats imposed more workload than VSD formats and there was a strong correlation between the objective results and subjective opinions. (Author)

A82-14745 # **Assessing pilot workload - Without disturbing pilot behavior.** R. J. Elder (USAF, Warner Robins Air Logistics Center, Robins AFB, GA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 565-571.

The need for the design of practical pilot workload assessment techniques which do not obstruct the normal operational procedures of the pilot subjects is discussed. An analysis of the pilot tasks in an air-to-air engagement is presented. Workload assessment techniques are analyzed for their applicability to the single-seat fighter environment. The procedure for design of an experiment using these techniques is demonstrated for an F-15 air-to-air engagement. Applications of the method in weapon system modification and operational training evaluation are discussed. (Author)

A82-14750 **Evaluation of advanced air-to-air gunnery fire control systems.** N. M. Shah and J. Stalony-Dobrzanski (Northrop Corp., Aircraft Div., Hawthorne, CA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 615-622.

Three advanced fire control systems, based on the director-type radar fire control system, were designed for an advanced fighter aircraft. These systems are: fixed gun, trainable gun, and integrated fire flight control (IFFC). In addition, an automatic range control (ARC) system, which uses radar information for maintaining range with respect to target, was designed. The air combat performance with each system was evaluated on the simulator with realistic radar noise and hardware constraints. The ARC was evaluated with fixed gun only. The results show definite superiority of the trainable gun, even with relatively modest gun travel and servo power, over a fixed gun and IFFC. The trainable gun, IFFC, and ARC concepts provide improved tracking performance, with considerable reduction in pilot workload, over the fixed gun. The time to achieve first hit is shortest with the trainable gun. The ARC enhances survivability by minimizing overshoots with respect to the target. (Author)

A82-14759 # **Assessment methodology of the lightning threat to advanced aircraft.** R. A. Perala (Electromagnetic Applications, Inc., Denver, CO) and G. A. DuBro (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 6[illegible] 697. 19 refs.

An overview of an assessment methodology concerning the lightning susceptibility of aircraft is presented. Work in this area is concentrated on increasing the general understanding of the physics of the aircraft-lightning interaction and on developing specific laboratory threat simulation testing techniques. Recent advances in both testing/simulation and analytics are discussed. These advances have been made possible by the incorporation of nuclear electromagnetic pulse technology and recent indications from measurements of natural lightning which suggest that significantly greater electromagnetic energy exists in the frequency range where increased coupling of such energy to the aircraft is possible. B.J.

A82-14760 The Navy F/A-18A Hornet electromagnetic compatibility program. J. R. Ketterer (McDonnell Aircraft Co., St. Louis, MO) and J. J. Fisher (U.S. Naval Air Systems Command, Washington, DC). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 698-702.

The F/A-18A Hornet is a first line carrier-deployed aircraft employing advanced composite structures and state-of-the-art digital electronics. Because the electromagnetic environment (EME) generated on present day carrier decks can reach field strengths over 10,000 Volts/meter at some frequencies, electromagnetic compatibility (EMC) challenges were presented. The approach to aircraft EMC design established for the F/A-18A required using the airframe as an enclosed electromagnetic (EM) shield. This shielding concept allowed equipment located within the airframe shield to be designed to a less severe EM environment than equipment located outside the airframe shield. Using the airframe as an electromagnetic shield presented a significant challenge, particularly because graphite/epoxy composites represent more than one-third of the F/A-18A surface area. Overall, this concept was found to represent the least cost, weight, and design impact both to the airframe and to the electrical or electronics equipments. (Author)

A82-14761 A recursive time domain analysis of distributed line grid networks with application to the LTA/EMP problem. W. S. McCormick (Wright State University, Dayton, OH). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 703-708.

Modeling the aircraft fuselage as a two-node, TEM, lossy distributed network, a recursive time domain technique is presented to estimate the fuselage skin-current induced by a remote lightning strike. The technique involves the determination of the two discrete nodal transfer functions followed by an application of Duhamel's theorem to the distributed electromagnetic excitation case. The Fourier transform of the induced fuselage skin-current is presented as a function of the azimuth and elevation angles of the incident, plane electromagnetic lightning excitation. Reference to the PORTER and NOAA flight programs is made along with a discussion of future application areas. (Author)

A82-14762 New advances in signal processing technology for integrated CNI avionics. C. R. Ward and R. A. Reilly (ITT, ITT Avionics Div., Nutley, NJ). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 712-722. 20 refs.

Functionally integrated CNI (communication, navigation, and identification) radio systems appear to be attractive as a means of resolving size and weight conflicts between conventionally designed radio systems on space-limited tactical military aircraft. In practice, integration is often frustrated by basic incompatibilities between widely divergent signal structures. Although there are many very complicated aspects to the problem of functional integration, this paper addresses only the problem of accommodating the reception of different signal structures efficiently and flexibly in the RF to baseband domain. A radically different approach to radio receiver design is proposed, which employs high speed digital and/or CCD technology which could be ready for field deployment by the 1990 time frame. Several alternative system level architectures are proposed and the tradeoffs between them evaluated. (Author)

A82-14763 Advanced integrated CNI architectures. P. C. Camana, S. K. Ogi, and L. R. Stine (TRW Defense and Space Systems Group, Redondo Beach, CA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 723-728.

Integrated terminal architectures can produce a modern CNI (communications, navigation, and identification) system at an affordable life-cycle cost within real estate requirements. Major considerations include use of common modules, RF and digital large scale integration (LSI) technology insertion, and high performance programmable digital signal processing. The RF subsystem consists of conventional RF and IF chains of common modules combined with the RF-LSI technology. The digital processing subsystem is an array of programmable signal/data processors with the core element being a VLSI 100 MIPS single card signal processor. Common modules, network reconfigurability, and high level of integration will provide for lower life-cycle costs with reduced systems size, weight, and power dissipation. (Author)

A82-14766 The agile transversal filter - A flexible building block for ICNIA. D. G. Botha (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) and F. W. Smead (ITT, ITT Avionics Div., Nutley, NJ). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 735-740. USAF-sponsored research.

Integrated Communications, Navigation and Identification Avionics (ICNIA) is an advanced development program to demonstrate an integrated systems approach to the implementation of functions normally performed by a collection of independent black boxes. The system design partitions all CNI functions to optimize modular commonality within the ICNIA system. One function required in many parallel channels is the processing of signals with instantaneous bandwidths of 10 MHz or less. A specific implementation is the Narrow Band Agile Transversal Filter (NBATF), which can be implemented in state-of-the-art technology, can process signals with a variety of algorithms selectable under software control, and can be replicated within the system, as required, to perform the total set of functions. The NBATF constitutes a building block module within the ICNIA system. (Author)

A82-14767 Applications of covariance analysis simulation to avionics flight testing. A. Foote, C. Vellenga, J. Price, and W. Buchholz (Logicon, Inc., Dayton, OH). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 750-756.

The application of covariance analysis simulation techniques to the conduct of developmental flight test of integrated navigation systems is presented. In particular, this paper describes how covariance analysis simulation techniques are being used in the planning, execution, and analysis phases of the B-52 Offensive Avionics System (OAS) flight test and discusses how they may be applied to future testing. The mission flexibility of modern strategic aircraft and the built-in redundant modes of operation define a large number of scenarios which must be tested. The role of covariance analysis simulation techniques in the B-52 OAS flight test is to assist in the planning and execution phases and to provide information supplemental to actual flight-test results. Discussions of the use of covariance analysis simulation techniques in each of these test phases are presented together with a sample of results from a B-52 OAS flight test. (Author)

A82-14768 Application of multiple model estimation techniques to a recursive terrain height correlation system. W. Tang and G. L. Mealy (Analytic Sciences Corp., Reading, MA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 757-764. Grant No. DAAK80-79-C-0266.

This paper describes the results of a study which determined the performance capabilities of a recursive terrain correlation system proposed for low altitude helicopter navigation. A Monte Carlo simulation program was developed to asses the effectiveness of the terrain correlation algorithm. The sensitivity of the system to various error sources was evaluated and filter modifications to enhance system performance were proposed. An alternate configuration, based upon multiple model estimation techniques, was shown to afford a substantial decrease in system sensitivity to initial position uncertainty. (Author)

A82-14769 # **Algorithms for an adaptive dynamic window in electronic map systems.** D. L. Sander (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 766-768.

Algorithms have been developed for an adaptive dynamic window which closely conforms to irregular shaped areas. These algorithms advance the window as the aircraft moves, adapt it to new geometries as they evolve, and provide for buffer zones in advance of expected movement and maneuvers. This paper describes these algorithms following a brief discussion of past and present dynamic window techniques used by the Air Force Wright Aeronautical Laboratories Avionics Laboratory. (Author)

A82-14770 **Airborne Electronic Map Systems. I - Design.** R. Hoffman and G. Burnham (Texas Instruments, Inc., Dallas, TX). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 769-772.

The requirements and implementation of an Airborne Electronic Terrain Mapping System (AETMS) are discussed. Display formats with plan views, flat images, and perspective views, all comparable to window or boresight images or viewpoints other than the pilot's, simulation of aircraft motion at speeds up to Mach one, and cost effectiveness, i.e. minimum cost, and interface capabilities are mentioned as necessary aspects for simulation or in-flight use. The data flow comprises a series of refinements of raw terrain data and time dependent user parameters, and the limiting factor of storing only pertinent regional data for airborne use due to technological weight restrictions for stored memory is stressed. Processing and regional memory selection are examined, including the use of up to 13 multipliers and 60 adders to perform up to 80 million operations/sec for a full range of CRT image generation. M.S.K.

A82-14771 **Airborne Electronic Terrain Map System.** J. W. Weber and E. W. Opittek (Hughes Aircraft Co., El Segundo, CA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 773-778.

The paper reports on the Airborne Electronic Terrain Map System Program, which has resulted in the development of a flyable brassboard for the evaluation of display applications for the Defense Mapping Agency digital data base. A summary of the display formats and supporting simulations such as the plan view contour and perspective views is given, and a system description is presented, which reviews features such as the regional memory, display generator, software, and support equipment. D.L.G.

A82-14772 **Passive terrain following using stored map and global positioning system.** A. C. Woodward and W. M. Hoover (Texas Instruments, Inc., Lewisville, TX). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 779-785.

The configuration and preliminary results are presented for a flight test program conducted to illustrate the potential for passive terrain-following (TF) flight by combining current map storage, the NAVSTAR Global Positioning System (GPS) and TF algorithm technologies. Primary aspects of the GPS/MAP TF system and flight test program include terrain profile descriptions, GPS position and aircraft state information, and TF command computation. Results indicate that position/map techniques can be used in low-level flight control, and eventually operational systems should control primarily from position and map information. D.L.G.

A82-14773 **Airborne Electronic Terrain Map System. II - Applications.** G. Burnham and C. S. Kline (Texas Instruments, Inc., Dallas, TX). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 786-789.

Applications of the Airborne Electronic Terrain Map System are considered. These include: (1) the provision of covert, all-weather weapon delivery for combat aircraft; (2) the use of stored terrain data to substitute for data normally provided by a forward-looking sensor; (3) the use of stored terrain data to generate a display that the pilot can use to fly low and avoid terrain higher than aircraft altitude; and (4) the extension of the system to sensor blending concepts with radar and FLIRs. S.C.S.

A82-14774 **Technical/operational ATC scenarios for future TMA navigation.** K. D. Kricke and L. Knapp (Elektronik-System-Gesellschaft mbH, Munich, West Germany). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 792-799. 8 refs.

Air traffic control is discussed in terms of the entire air traffic system, and as a national authority. The terminal maneuvering area (TMA) is considered with reference to typical configurations, approach and departure phases, and such areas for improvement as possibilities for increased capacity, environmental protection, and fuel-saving flight profiles. A number of possible advances in TMA scenarios are identified, including three- and four-dimensional navigation, secondary radar systems and data-processing systems for automated air traffic control. S.C.S.

A82-14775 **Some Italian research for developing new primary ATC radars.** M. Calamia (Firenze, Università, Florence, Italy). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 800-807. 15 refs.

A survey of Italian research on primary air traffic control radar systems is presented. Types of clutter affecting such systems are discussed, and the parameters defining the filter capacity of radar with respect to clutter are identified as the improvement factor and subclutter visibility. Studies conducted to characterize dynamic clutter phenomena at airports in Rome and Naples in 1979-1980 are reported. Attention is given to adaptive moving target indicator filtering techniques. A method for the recording and analysis of atmospheric clutter echoes using an orthogonally polarized double-channel receiver is considered. S.C.S.

A82-14776 **Performance evaluation of target report extractor in the monopulse ATCRBS.** D. Giuli, M. Fossi (Firenze, Università, Florence, Italy), and E. Dalle Mese (Pisa, Università, Pisa, Italy). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 808-815. 11 refs. Research sponsored by the Consiglio Nazionale delle Ricerche.

In this paper some results are reported, obtained via an analytical approach, which are relevant to the performance evaluation of an Air Traffic Control Radar Beacon System (ATCRBS) monopulse extractor to be devised in a Discrete Address Beacon System (DABS) for Air Traffic Control (ATC). Suitable statistical models of the correlation tests used by the dwell-time section of the receiver are developed. The obtained results refer to a statistical analysis of the dwell-time section which performs the defruiting function. (Author)

A82-14777 **A multimicroprocessor system for ATCRBS monopulse data processing.** E. Borgheresi, D. Giuli, F. Pirri (Firenze, Università, Florence, Italy), G. Oppimiti, and C. Poli (Marina Italiana Istituto G. Vallauri, Leghorn, Italy). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 816-822. Consiglio Nazionale delle Richerche No. 80,00386,91.

In this paper the problem of the dwell time processing of aircraft replies in the Air Traffic Control Radar Beacon System (ATCRBS) section of the Discrete Address Beacon System (DABS) is considered. A solution is suggested which is based on the use of a multimicroprocessor system. A brief description of the hardware structure of the system is given and the algorithms used for processing the replies are shown. Such algorithms aim at improving the efficiency of correlation procedures among reply reports received by the same target during the antenna dwell time. Parallel processing is obtained through a 'sliced-azimuth' subdivision of the amount of the total job. (Author)

A82-14778 **Flight management systems for modern jet aircraft.** R. H. Farmer (General Motors Corp., Delco Electronics Div., Goleta, CA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 823-829. Contract No. F09603-79-C-1610.

Attention is given to flight management computer systems for modern jet aircraft, noting tests run on Air Force C-141 aircraft. Fuel-saving aircraft operations are identified, including optimum takeoff and climb schedules, cruise Mach control, optimized altitude selection, delayed flaps, ATC flow control, and area navigation/direct routing. Data from the C-141 Fuel Savings Advisory System are reported. In this system, the flight management system provides vertical navigation, speed control, flight planning control, and horizontal flight path commands to the inertial navigation systems. The data show that significant fuel savings are possible by close attention to many small efficiencies of flight operations. S.C.S.

A82-14779 **Weather impact on low-altitude imaging infrared sensors in Europe - An availability model.** E. R. Edge (Analytic Sciences Corp., Reading, MA), J. D. Malick, and J. H. Allen (SRI International, Menlo Park, CA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 832-839. 5 refs.

This paper discusses the development of a methodology for evaluating the availability of low-altitude electro-optical (EO) sensors for imaging of ground targets. Because of the wide range of possible target types and their possible geographical distribution, a flexible tool for the assessment of current and future sensor designs is presented. This analysis tool, which is available as a FORTRAN computer program named WEATHER, includes a statistical model of all weather effects, accounts for seasonal, diurnal and geographical variabilities, allows for arbitrary distributions of targets, and provides estimates of simultaneous outages over wide geographical areas. (Author)

A82-14780 **Study of the effects of maneuver compensation on beam pointing accuracy.** D. E. Miracle (Logicon, Inc., Dayton, OH). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 840-846. Contract No. F33657-78-C-0490.

It is commonly necessary to aim an airborne antenna consistently at a target antenna. This aiming is simple enough when angle measuring resources are devoted to the target, but these resources are available only a small fraction of the time. Consequently, with no compensation during maneuvers and between measurements, the antenna may be aimed significantly off target. Consideration of this problem for present medium performance aircraft having state-of-the-art navigational and EW systems indicates that several simplifying mathematical approximations are justifiable. These lead to a set of compensation algorithms which are operationally and computationally superior to known alternative methods. The method involves performance angle measurements at a slower rate than is normally required, relying upon a set of intermediate pointing corrections for coverage maintenance. The forms of the algorithms are simple enough to permit implementation on the EW computer, or if necessary, other hardware. (Author)

A82-14788 **Conceptual design of an integrated power and avionics information system.** G. L. Dunn and P. Leong (Boeing Military Airplane Co., Seattle, WA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 954-962. 5 refs. Contract No. F33615-80-C-2004.

A nonintegrated DAIS type architecture has been used as a baseline to determine power system control requirements for a two-engine tactical aircraft and to assess the relative merits of the hierarchical and integrated architectures. Two power generation and distribution configurations using solid state power controllers, three power control system concepts, and two integrated power and avionics architectures were considered. It is found that the integrated architectures with smart ELMCs (electrical load management centers) represents the best utilization of the data bus and has acceptable processor loading. The processor overhead is the least and both logical equation processing and bus loading make optimum use of the available DAIS technology capabilities for a single data bus. P.T.H.

A82-14789 **60 kVA ADP permanent magnet VSCF starter generator system - A program overview.** R. C. Webb (General Electric Co., Binghamton, NY). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 963-965. Contracts No. F33615-78-C-2200; No. F33615-74-C-2037.

The paper reviews an Air Force-sponsored program to design, construct, demonstrate flight worthiness, and flight test 60 kVA variable speed constant frequency (VSCF) permanent magnet (PM) electrical starter/generator systems using high energy product samarium cobalt magnets in an all metallic solid rotor. PM VSCF system offers a significant improvement in electrical generating system efficiency over presently used systems. The PM VSCF also offers a simplification of the engine auxiliary gearbox area and aircraft ducting by combining the engine starting and electrical power generation functions into one system. P.T.H.

A82-14791 **High speed PMG containment study for VSCF system.** M. M. Youn (General Electric Co., Erie, PA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 971-977. 6 refs. Contract No. F33615-80-C-2032.

A permanent magnet rotor containment method chosen for variable speed constant frequency (VSCF) applications is described. The containment method employs amortisseur bars in the magnetic member of the bimetallic shrink ring to reduce the commutating reactance of the generator for stable converter operation. The significantly higher energy product combined with high temperature capability of the magnet provides the basis for permanent magnet machines which are smaller, higher in efficiency, and more reliable than wound rotor machines. P.T.H.

A82-14792 **Failure analysis of variable reluctance stepper motor.** D. L. Hart and J. A. Ziegenhagen (Dayton, University, Dayton, OH). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 978-982.

The variable reluctance stepper motor is an integral part of the electronic fuel control system on a jet engine in that it regulates the fuel flow to the engine. The stepper motor is required to operate in a high temperature environment while immersed in a jet fuel. This paper reviews the failure modes, analysis techniques, and the recommended corrective actions. (Author)

A82-14793 **The payoff from U.S. investment in aeronautical research and development.** R. C. Lenz (Dayton, University, Dayton, OH). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 984-991. NSF Grant No. SRS-79-10397.

This paper presents a quantitative analysis of the returns on U.S. investments in aeronautical research and development over the fifty years from 1926 to 1976. The returns on the investment are those obtained through productivity improvements in the airline industry, independently of any other returns. The net gains from the R&D expenditures are very large in comparison with standard commercial opportunities during the same period. However, neither the aircraft builders who performed most of the R&D, nor the airlines who bought and used the aircraft, received the largest part of the gain. Instead, the gains were distributed primarily to the traveling public, and to a lesser extent to airline employees. A key point of the research is the construction of probable aeronautical R&D expenditures for the years before 1957, the first year for which National Science Foundation statistics are available. Another feature is the use of seat-mile data as the appropriate measure for airline output in the productivity calculations. An innovative concept, the use of hypothetical 'phantom fleets' to determine productivity gains, is introduced. (Author)

A82-14794 **Parallel processing applied to digital flight control systems - Some perspectives.** T. F. Westermeier (McDonnell Aircraft Co., St. Louis, MO). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 1010-1017.

Parallel processing techniques are thought to have the potential for increasing the performance of digital flight control systems. A number of issues are addressed to determine if the potential can be realized. The composition of generic flight control software is examined to determine its amenability to parallel solution. From this examination, two prototype software decompositions and their resulting architectures are proposed and evaluated in terms of iteration rate, transport lag, and computation time. The impact of parallel processing on size, weight, power, and reliability is examined next. Finally, the throughputs of microprocessors are evaluated to determine their suitability as processing elements. (Author)

A82-14796 **Microprocessor flight control application study.** F. C. Neebe, S. J. Hissong (General Electric Co., Binghamton, NY), and W. E. Nelson, Jr. (Northrop Corp., Aircraft Div., Hawthorne, CA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 1022-1029.

Digital flight control computers are now being used to implement control functions on high performance military aircraft. Microprocessor technology has advanced to the point where it is possible to implement many simple control functions. Several microprocessor subsystems working in parallel can be used to set up systems which have extensive control capability. This paper describes the results obtained from setting up a small microprocessor system to perform pitch control for a modern lightweight fighter aircraft. Information is presented detailing system configuration and response. (Author)

A82-14814 **Implementing the DAIS executive.** S. W. Behnen (Boeing Military Airplane Co., Seattle, WA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 1149-1154. 8 refs.

The Boeing Military Airplane Company has been studying the feasibility of applying the DAIS executive to a production aircraft system. The advantages and disadvantages of implementing a member of the DAIS executive family have been investigated for several existing and projected aircraft systems: new and upgraded avionics systems; flight control systems; and an electrical power distribution and control system. Although certain operational requirements for these systems will entail enhancements in the current executive design, the basic philosophy and structure of the DAIS executive make it desirable in each of these systems. As a result of its favorable review of the DAIS executive, BMAC is proposing to use DAIS executive variants on new systems such as an electrical power and distribution system and an avionics system. The decision to implement a DAIS executive in an upgraded version of an existing system will depend on the result of cost/benefit trades. (Author)

A82-14817 **A storage device for subsystem maintenance information.** C. J. Tavora and H. M. Collins (Houston, University, Houston, TX). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 1170-1174. Contract No. F33615-80-C-1095.

This paper describes the Electronic Nameplate (ENP) - an electronic storage device which may be attached physically to avionic subsystems to store information relevant to their identification, interface specifications, calibration procedures, fault-isolation tests and operational performance. The ENP can be integrated into a single chip device with a standard connector through which it receives power and communicates. Prototypes of the ENP have been implemented and tested for the Air Force Wright Aeronautical Laboratories. (Author)

A82-14819 **Computer modeling of an aircraft HVDC electrical system.** J. D. Segrest (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA) and D. L. Sommer (Boeing Military Airplane Co., Seattle, WA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 1192-1199. 11 refs. Contract No. N62269-79-V-0265.

This paper describes the development of mathematical models, which represent typical 270 VDC aircraft electrical systems, and the analysis of these models on the EASY Model Generation and Analysis Program. The mathematical models of the following components of a high voltage dc (HVDC) electrical system were developed: (1) buck multiple loop switching regulator with EMI input filter; (2) dc solid rotor generation system; (3) dc wound rotor generation system; (4) flat conductor distribution bus; and (5) aircraft load. The EASY program is then used to analyze a system by specifying the topology of a network of these predefined components. Sample simulation results are included. (Author)

A82-14820 **Digital simulation of aircraft electrical generating system by means of Sceptre program.** D. Fair, J. Dhyanchand, E. Parker, and H. Bahanassy (Sundstrand Advanced Technology Corp., Rockford, IL). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 1200-1205. 5 refs.

A computer program is presented which simulates the aircraft electrical generating system. In this computation analysis, a constant speed drive with electronic governor, brushless aircraft ac generator, and voltage regulator are simulated as a system. These subsystems were linked for a complete aircraft electrical power generating system by means of the Super-Sceptre program and FORTRAN subroutines. The 60 KVA Sundstrand Aircraft Generating System was simulated with this model for on-off transient loads. The simulated results were found to be in close agreement with experimental data. (Author)

A82-14821 **Computer simulation of an advanced aircraft electrical system.** A. J. Marek, D. F. Sellers (Vought Corp., Dallas, TX), and D. Fox (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 1206-1215.

Computer simulation programs which were developed for advanced aircraft electrical system designs are described. The programs consist of four separate modules encompassing the IDG generating system, VSCF generating system, parallel generator operation, and the power distribution system. Each program is written in FORTRAN V and is based on data supplied by power generating system manufacturers and data derived from various texts. This paper describes the procedure for program development; program features, structures, parameters, and accuracy; and program solution run times. The capabilities of the developed programs are discussed, and a representative sample of simulation runs with computer plots are presented. P.T.H.

A82-14823 # **Airborne color CRT displays.** H. L. Waruszewski, Jr. (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21,

1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 1224-1243. 15 refs.

It is suggested that new human factors data and cockpit requirements need to be developed and applied to color cockpit displays so that requirements for a usable display can be generated. The color display technology needs to be evaluated with regard to satisfying the established human factors requirements. Test methodologies need to be developed to determine the compliance of the color displays with the specification requirements. In addition, color displays need to be integrated into the cockpit using total cockpit human factors criteria to maximize the possible workload reduction and safety of the aircraft. Such color display technologies as beam penetration color CRT and shadow mask color CRT are described, and applications of color CRTs (including tactical and map displays, and flight control and engine displays) are considered. P.T.H.

A82-14824 **The Maneuvering Flight Path Display - A flight trajectory solution display concept.** J. F. Watler, Jr. and W. B. Logan (Northrop Corp., Aircraft Div., Hawthorne, CA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 1254-1260. 5 refs.

The Maneuvering Flight Path Display (MFPD) provides to the pilot an anticipatory, real-time presentation of the command flight path. The presentation depicts the 'solution' of the desired trajectory, thus telling the pilot 'what to do' and 'how to do it'. This information is displayed graphically, eliminating the need for the traditional dials, scales, pointers, or alpha-numeric readouts. The pilot, by controlling the aircraft to fly just above the graphical flight path being portrayed, is assured of precise 4-D trajectory control. It is concluded that the success of the MFPD development and the consequent rapid maturation of the concept has stimulated a widespread interest in advancing the program to flight demonstration as quickly as possible. P.T.H.

A82-14825 # **The LANTIRN wide field-of-view raster Head-Up Display.** R. L. Berry and J. C. Byrd (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 1261-1268.

As part of the Low Altitude Navigation and Targeting Infrared for Night (LANTIRN) System, a new Head-up Display (HUD) is being developed as replacement for the existing HUDs in the F-16 and A-10 aircraft. The primary improvements will be greatly increased field-of-view and the capability to display Forward Looking Infrared (FLIR) video. The HUD will use diffraction optics in the combiner as the main tool by which improvements in field-of-view, contrast ratio, and see-through visibility are achieved. This paper is an overview of the use of diffraction optics in the LANTIRN HUD. (Author)

A82-14826 **Enhanced aircraft handling qualities by longitudinal dynamics mode decoupling.** H. Y. Kim, R. H. Rooney, and E. Y. Shapiro (Lockheed-California Co., Burbank, CA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 1270-1275.

The present paper investigates decoupling procedures using output feedback on longitudinal axis dynamics of a wide body transport aircraft. The possibility of decoupling through output feedback is rather restrictive compared to the possibility of full state feedback. Therefore, when output feedback decoupling is not possible, the state variables are reconstructed by the Luenberger observer to be used in full state feedback decoupling of the system. The results of this approach are presented via simulation. (Author)

A82-14827 **A synthesis technique for highly uncertain and interacting multivariable flight control systems.** I. Horowitz, O. Yaniv, B. Golubev, and L. Neumann (Weizmann Institute of Science, Rehovot, Israel). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 1276-1283. 7 refs. Grant No. AF-AFOSR-80-0213.

A recent synthesis technique has the attractive property that the uncertain multiple input-output (MIO) feedback problem, is converted into a number of uncertain single-loop problems. Under certain general conditions, the solutions of the single-loop problems are guaranteed to be satisfactory for the MIO problem. This technique is applied to the Ay-direct side force mode of a fighter CCV aircraft. The objective is to achieve fast Ay response with small sideslip and roll, over a range of flight conditions. Three designs of varying complexity are presented with simulation results. The technique clearly reveals the conflicting design factors and trade-offs. (Author)

A82-14828 # **Direct digital design method for reconfigurable multivariable control laws for the A-7D Digitac II aircraft.** D. W. Potts (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) and J. D'Azzo (USAF, Institute of Technology, Wright-Patterson AFB, OH). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 1284-1291. 8 refs.

This paper investigates control of an aircraft when there is a primary control surface failure. The object of this study is to reconfigure the remaining control surfaces to compensate for the additional forces and moments generated by the inoperative control surface. To study this flight control problem, a comprehensive aircraft model is required which considers each control surface operating individually. A six degree-of-freedom aircraft model is developed, including all the individual control surfaces. The additional coupling between the axes requires the derivation of several new non-dimensional control derivatives. With the new comprehensive aircraft model, the entire eigenstructure assignment method is used to assign both the eigenvalues and the eigenvectors to the closed-loop plant matrix. This method is used for the direct digital design of a multivariable discrete regulator control law. (Author)

A82-14829 **Design of direct digital flight-mode control systems for high-performance aircraft.** B. Porter and A. Bradshaw (Salford, University, Salford, Lancs., England). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 1292-1298. 5 refs. Contract No. F49620-81-C-0026.

The general results of Bradshaw and Porter (1981, 1981) on discrete-time tracking systems are used to design fast-sampling error-actuated digital controllers and associated transducers which effect fuselage pitch pointing and vertical translation maneuvers in the case of the F-16 aircraft. It is thus demonstrated that these severe maneuvers can be readily effected by appropriate fast-sampling error-actuated digital controllers which generate practically acceptable flaperon and elevator deflections. Furthermore, it is also demonstrated that such fast-sampling digital controllers are extremely robust. (Author)

A82-14831 **General purpose real-time interaction panel for digital simulation.** M. T. Lansdaal and M. E. McSharry (Boeing Military Airplane Co., Advanced Airplane Branch, Seattle, WA). In: NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1981, p. 1305-1310.

Real-time simulations for modelling aircraft or flight control systems often need a controlled real-time event insertion and event monitoring capability. This capability is necessary to study the responses of the simulated system to controlled events or disturbances. A description is presented of an approach providing the solution of event/fault insertion and event monitoring requirements. The approach makes use of an intelligent device, known as the Fault Insertion Panel (FIP), which consists of a minicomputer with a Multiprocessor-Communications Adapter, a Direct Memory Access I/O board, a video terminal, and a hand held control box. The FIP is an inexpensive and versatile replacement for special purpose hardware, such as an aircraft cab/flight deck, and analog instrumentation that must interact with a digital simulation. G.R.

A82-14856 **AN/TPN-25 and AN/GPN-22 precision approach radars.** H. R. Ward (Raytheon Co., Wayland, MA). In: International Radar Conference, Arlington, VA, April 28-30, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 26-31.

A Precision Approach Radar (PAR) is used in a Ground-Controlled Approach (GCA) aircraft landing system to make accurate aircraft position measurements during the final approach to the runway. The PAR recently developed for the U.S. Air Force uses a limited scan phased array to scan, acquire, and track landing aircraft. This paper describes the transportable and fixed-site models of this PAR as well as the results of field tests to verify their coverage and measurement accuracy. (Author)

A82-14857 **Radar hostile fire location.** D. J. Colliver (Royal Signals and Radar Establishment, Malvern, Worcs., England) and J. D. Holcroft (Racal-MESL, Linlithgow, Scotland). In: International Radar Conference, Arlington, VA, April 28-30, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 32-37.

Methods for detecting an attack involving the firing of projectiles are considered, taking into account also the determination of the direction to the source of fire. It is found that for the considered objective, radar-based approaches have important advantages compared to other methods. The requirement for the radar to track projectiles down to short ranges favors the use of a CW system and Doppler processing. Suitable radar hardware is discussed along with aspects of signal processing, taking into account a hybrid processor and a digital processor. Radar systems of the considered type are used in fixed and mobile installations in a security role and have also been installed covertly in armored VIP limousines. Other applications are related to a battlefield environment. G.R.

A82-14868 **Commercial airborne weather radar technology.** G. A. Lucchi (RCA, Avionics Systems Div., Burlington, MA). In: International Radar Conference, Arlington, VA, April 28-30, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 123-130.

From World War II until very recently, there has been little change in the technology of commercial airborne weather radar. The technique being used is still based on the concept of differentiation between various radar backscatter intensities which can be related to rainfall rate. The radar backscatter coefficient for various rainfall rates has been determined sufficiently well for weather radar design calculations. Experiments continue at this time because there are widespread backscatter coefficients depending on such variables as temperature, raindrop size, raindrop shape, and turbulence in the storm cell. Two aircraft were equipped for the conduction of airborne experiments in an attempt to better correlate radar signals with measured turbulence in storm cells. At least three radar manufacturers are developing airborne weather radar systems complying with a new characteristic for a weather radar. Recently a low-cost weather radar system which can be mounted in the leading edge of a single-engine aircraft wing was introduced. G.R.

A82-14871 **Inverse SAR and its application to aircraft classification.** G. Dike, R. Wallenberg (Syracuse Research Corp., Syracuse, NY), and J. Potenza (USAF, Rome Air Development Center, Griffiss AFB, NY). In: International Radar Conference, Arlington, VA, April 28-30, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 161-167.

Two-dimensional radar images of aircraft have been simulated with parameters similar to those of the ARPA/Lincoln C-Band Observables Radar (ALCOR) which has been used in actual radar imaging studies. Development of such a simulation program was necessitated by a need to provide a controlled flight situation to study aircraft image projection planes, and a desire to use the simulation to aid in developing sorting algorithms for use in aircraft classification. The classification approach taken avoids the problem of extraneous responses due to multiple rays, engine modulation, internal antenna scanning, and the addition of stores to the unknown aircraft. A degree of insensitivity to poor focusing is also expected. B.J.

A82-14881 **Air-to-ground MTI radar using a displaced phase center, phased array.** M. L. Stone and W. J. Ince (MIT, Lexington, MA). In: International Radar Conference, Arlington, VA, April 28-30, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 225-230. 5 refs. USAF-sponsored research.

An airborne MTI radar capable of performing surveillance of tactical targets has been assembled and field tested. The design features an electronically scanned displaced phase center antenna, an advanced digital signal processor, and real-time, automated target acquisition and display. The radar represented a scaled model of an all-weather long-range system. Results obtained in the rejection of clutter, the detection of moving targets, and the acquisition and tracking of targets are discussed. (Author)

A82-14908 **A new approach to radar plot extraction for ATC applications.** N. Accarino and E. Giaccari (Selenia S.p.A., Rome, Italy). In: International Radar Conference, Arlington, VA, April 28-30, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 391-396.

It is noted that the capabilities of modern ATC radars require more effective target coordinate evaluation and target resolution capabilities in the extractor than have been available in the past. The availability of powerful processing tools, such as microprocessors, makes possible the implementation of sophisticated algorithms to provide optimum radar plot extraction. A new extraction algorithm, implemented by means of a simulation approach, is described. The improvement in performance is extensively compared with the values obtained using a conventional extractor. The approach described here is given in terms of the following improved characteristics: range and azimuth accuracy, range and azimuth resolution, and target qualification. C.R.

A82-14909 **Extended time radar raw video recording.** R. Inagaki and M. Mochii (Nippon Electric Co., Ltd., Tokyo, Japan). In: International Radar Conference, Arlington, VA, April 28-30, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 397-402.

An attempt is made to develop extended time recording of the radar video for analyzing air traffic control accidents. The combination of a commercial time-lapse video cassette tape recorder and sophisticated video time-compression techniques with radar bandwidth compression demonstrates its validity in realizing 32 hour recording of the ARSR video without deteriorating its image quality from a practical point of view. Improvement in some circuit instability will make it possible to put this newly developed equipment into actual operation in association with magnetic tape recording of the processed digital radar data. C.R.

A82-14927 * **The X-14 - 24 years of V/STOL flight testing.** R. M. Gerdes (NASA, Ames Research Center, Moffett Field, CA). *(Society of Experimental Test Pilots, Symposium, 25th, Beverly Hills, CA, Sept. 23-26, 1981.) Society of Experimental Test Pilots, Technical Review,* vol. 16, no. 2, 1981, p. 3-21. 7 refs.

The X-14 V/STOL research aircraft made its first free-hover flight as a proof-of-concept test-bed on Feb. 19, 1957. With the exception of two subsequent modification periods (to X-14A and X-14B) this V/STOL 'workhorse' has been on continuous flight-test status as a research aircraft and flying classroom. The paper presents some of the highlights of its memorable 24-year flight-test career with special emphasis on projects which have contributed to V/STOL technology and on the test pilots who made it happen. (Author)

A82-14928 **Bell-Bertoe Jetwing flight tests.** R. D. Kimberlin (Tennessee, University, Tullahoma, TN). *(Society of Experimental Test Pilots, Symposium, 25th, Beverly Hills, CA, Sept. 23-26, 1981.) Society of Experimental Test Pilots, Technical Review,* vol. 16, no. 2, 1981, p. 22-40.

Design features and flight test results of the Jetwing aircraft are reported. The Jetwing employs an upper surface blowing concept in that all engine air is ducted through the leading edge of the wing and ejected over the top surface of the wing through a slot nozzle to achieve supercirculation lift and STOL performance. The nozzle extends over 70% of the wingspan. A Coanda flap is mounted at the trailing edge of the blown portion of the wing and a smaller wing is located over the slot nozzle in low speed flight to reduce installed thrust losses. A test plane with a 21.75 ft wingspan, powered by a single 2200 lb thrust engine, has completed 137 test flights. Test instrumentation is described and in-flight performance with sawtooth climbs at over 55 knots airspeed yielded a lift coefficient of 3.5 and a blowing coefficient of 1.0. Takeoff and landing ground roll are less than 1000 ft, keeping within design goals of a STOL aircraft suitable for aircraft carrier and short, unimproved runway use. D.H.K.

A82-14929 **Flight investigations of integrated descent rate control systems.** W. D. Thompson. *(Society of Experimental Test Pilots, Symposium, 25th, Beverly Hills, CA, Sept. 23-26, 1981.) Society of Experimental Test Pilots, Technical Review*, vol. 16, no. 2, 1981, p. 41-53.

Results of tests to determine the effectiveness of spoilers for enhancing aircraft landing control are reported. Combining the spoiler with a throttle control formed a descent rate control which improved handling performance, produced effective drag control and lift and moment coupling, and expanded the approach airspeed window. The landing ground distances increased from 600 to 1000 ft as the approach angles increased. The spoiler control is viewed as a glide path control which establishes a linear relationship between rate of sink and throttle position. Inexperienced pilots were able to achieve touch-down accuracies comparable to those displayed by experienced pilots flying normal aircraft. No hard landings were encountered during landing testing, the higher approach speeds simplified landings in gusting conditions, and braking during landing roll was reduced. D.H.K.

A82-14930 **Progress report - CH-47 modernization program.** J. C. O'Connor (U.S. Army, Aviation Research and Development Command, St. Louis, MO). *(Society of Experimental Test Pilots, Symposium, 25th, Beverly Hills, CA, Sept. 23-26, 1981.) Society of Experimental Test Pilots, Technical Review*, vol. 16, no. 2, 1981, p. 54-64.

Progress toward improving the CH-47D sufficiently to fill the Army medium lift requirements through the year 2000 is reviewed. The mandatory mission profile includes pick-up of a 15,000 lb load at 4000 ft, at 95 F ambient temperature, climb 200 fpm for one minute, cruise outbound for 30 nm, and return with fuel reserves for 30 nm. The CH-47D employs twin turbine engines, tandem counterrotating blades, and can transport troops, cargo, and weapons in day, night, visual, and instrument conditions. An adaptation of the Chinook, the CH-47D has a 30 min oil-out capability, has passed through preliminary air evaluation tests, and features an advanced flight control system which allows hands-off flight. Reliability, availability, and maintenance tests revealed no uncorrectable problems after 342 flight hours, although blade coating may be necessitated by a sparkling phenomenon that occurs during night flights in sandy conditions. D.H.K.

A82-14931 **USNTPS spin program.** J. R. Watkins (U.S. Navy, Naval Air Test Center, Patuxent River, MD). *(Society of Experimental Test Pilots, Symposium, 25th, Beverly Hills, CA, Sept. 23-26, 1981.) Society of Experimental Test Pilots, Technical Review*, vol. 16, no. 2, 1981, p. 82-86.

The Navy Test Pilot School spin program is described, including test procedures for out of control flight and the aircraft employed. The T-2C Buckeye and X-26A Frigate are the current training aircraft. Students observe upright incipient, oscillatory, and nonoscillating spin and recovery, and are then required to perform similar maneuvers before practicing upright spins as command pilots. Inverted spins are terminated at -1.5 g, and parameters such as minimum entry altitude, mandatory action altitudes, and pre- and post-flight aircraft inspection are outlined. A 30 min out of control flight program is discussed, noting the presence of a chase plane to gather telemetry on rotation, roll, yaw, and pitch/angle rates, and on altitude loss (1000 ft/turn). D.H.K.

A82-14932 **The USAF Test Pilot School high angle of attack and spin training program.** M. D. Edmondson (USAF, Test Pilot School, Edwards AFB, CA). *(Society of Experimental Test Pilots, Symposium, 25th, Beverly Hills, CA, Sept. 23-26, 1981.) Society of Experimental Test Pilots, Technical Review*, vol. 16, no. 2, 1981, p. 87-91.

The training program at the Air Force Test Pilot School is reviewed. The course is conducted in academic, flight training, and reporting phases, and high angle of attack and spin conditions are accentuated. Students are exposed to in-depth studies of aerodynamic, inertial, gyroscopic, and other forces and moments necessary for fully developed spin. Flight training begins in sailplanes equipped with a tape recorder and a kneeboard, and proceeds to an A-37B with a 42 channel pulse code modulated data acquisition system. Spin missions are safety monitored by an instructor on TV provided by a radar tracking telescope. Spin recoveries in the sailplane and T-37B are described, including erect and inverted spins. An A-7D vehicle is employed for high angle of attack training, noting the hazard of pilot disorientation during high energy departures and rapid angular attitude changes. D.H.K.

A82-14933 **Navy spin evaluation of the A-7 airplane configured with automatic maneuvering flaps.** C. L. White and L. E. Parrish (U.S. Navy, Naval Air Test Center, Patuxent River, MD). *(Society of Experimental Test Pilots, Symposium, 25th, Beverly Hills, CA, Sept. 23-26, 1981.) Society of Experimental Test Pilots, Technical Review*, vol. 16, no. 2, 1981, p. 92-107.

Test results of Navy evaluation of automatic maneuvering flaps (AMF) on an A-7B aircraft are presented. The spin characteristics, the effects of asymmetric drop tank loading on the spin characteristics, and the effects of nose-up longitudinal trim on the A-7 departure recovery were examined. The AMF are on both leading and trailing edges of the wings; modifications to the A-7 necessitated by the use of AMF are listed, along with instrumentation and flight test procedures. AMF was found to enhance the departure, spin, and recovery handling characteristics. The asymmetric fuel tank loading was destabilizing at high angles of attack, but was negated by the presence of AMF. Recommended departure procedures were determined as optimal recovery techniques, and details of the flight test maneuvers for spin entry, recovery, and in asymmetric loading conditions are presented. D.H.K.

A82-14934 **F/A-18A high angle of attack/spin testing.** I. M. Behel and W. G. McNamara (U.S. Navy, Naval Air Test Center, Patuxent River, MD). *(Society of Experimental Test Pilots, Symposium, 25th, Beverly Hills, CA, Sept. 23-26, 1981.) Society of Experimental Test Pilots, Technical Review*, vol. 16, no. 2, 1981, p. 108-132.

High angle of attack (AOA) and spin test flights for the F/A-18A aircraft are discussed, noting that high spin resistance features of the control laws necessitated a second, separate set of control laws for spin recovery. Wind tunnel and model testing results are reviewed, with the 16% model yielding more accurate performance prediction than the 6% scale model. The control laws scheduled the maneuvering flaps to increase departure and spin resistance, with full flap extension an optimum configuration for AOA above 25 deg. Instrument feedback for longitudinal stability is outlined and the logic mode for spin recovery is discussed. Finally, the pilot cues, high AOA characteristics, and spin and spin recovery characteristics defined during flight testing are examined, and the benefits of spin recovery cockpit displays for rapid recovery in stressful situations are emphasized. D.H.K.

A82-14935 **KC-10 flight test program.** W. S. Smith (Douglas Aircraft Co., Long Beach, CA) and B. Hinds (USAF, Edwards AFB, CA). *(Society of Experimental Test Pilots, Symposium, 25th, Beverly Hills, CA, Sept. 23-26, 1981.) Society of Experimental Test Pilots, Technical Review*, vol. 16, no. 2, 1981, p. 136-143.

Test features and results of refueling interface with various aircraft with the KC-10 Advanced Tanker/Cargo Aircraft are reported. The program sought to define the performance characteristics and operational capabilities of a converted wide-body commercial plane, the DC-10 freighter, as a military cargo and refueling plane. Modifications for the refueling receptacle slipway, bladder fuel tanks, boom, and hose-drogue refueling system are outlined, along with instrumentation alterations. The KC-10 can carry 356,065 lb of fuel or 85 tons of cargo. Acceptable clearances for ground operations were demonstrated and damping of boom oscillations at high Mach numbers was achieved during tests refueling the C-5. Further tests with the B-52, A-10, F-16, F-4, F-15, A-7D and A-7K, aircraft as receptors were successfully completed. Twelve KC-10 aircraft will be operated to extend the Air Force's worldwide deployment operations. D.H.K.

A82-14936 **The all composite Lear Fan 2100.** H. G. Beaird, Jr. (Lear Fan Corp., Reno, NV). *(Society of Experimental Test Pilots, Symposium, 25th, Beverly Hills, CA, Sept. 23-26, 1981.) Society of Experimental Test Pilots, Technical Review,* vol. 16, no. 2, 1981, p. 144-153.

Design and performance features of the all-composite Lear Fan 2100 aircraft are described. The plane has two engines, one tail-mounted propeller, and can climb at 1400 fpm with one engine out. The structure is a graphite composite, which results in a greater range than with aluminum due to lighter weight, plus a longer lifetime due to higher durability. The engines provide 850 shaft hp apiece, and the metallic content in the oil is electronically monitored to remain within a wide safety margin. Standard ailerons, elevators, and rudders are controlled through cables and pushrods. The operational altitude is 41,000 ft at 435 mph, with the cabin pressurized to 8000 ft; use of one propeller eliminates the occurrence of asymmetric thrust conditions. Overall simplicity, reliability, durability, and safety were the guiding principles in the design of the aircraft. Nominal operation is given as a Mach 0.65 speed and 31,000 ft altitude. D.H.K.

A82-14937 **Acceptance testing of the Calspan variable stability Learjet.** W. J. Brooks, J. W. Smolka (USAF, Test Pilot School, Edwards AFB, CA), R. M. Norman (U.S. Navy, Test Pilot School, Patuxent River, MD), and A. E. Schelhorn (Calspan Advanced Technology Center, Buffalo, NY). *(Society of Experimental Test Pilots, Symposium, 25th, Beverly Hills, CA, Sept. 23-26, 1981.) Society of Experimental Test Pilots, Technical Review,* vol. 16, no. 2, 1981, p. 154-181.

The variable stability system incorporated into a Learjet for use as a flying classroom for USAF and USN Test Pilot students is described. Side-by-side cockpit seating, an observer station, a data station, and the capability of flight in a three-axis, fly-by-wire mode are provided. Various linear and nonlinear flight control system characteristics, along with simulating prefilter effects and transport delay are incorporated in the controls; a number of closed loop flight control system configurations are also included. Components of the variable stability system are discussed, noting the ability of the digitally controlled response feedback system to simulate control reactions of various aircraft in response to the student pilot's control actions when handling numerous aircraft dynamic configurations. D.H.K.

A82-14938 **F-15 SAR.** G. L. Jennings and P. Henry (McDonnell Aircraft Co., St. Louis, MO). *(Society of Experimental Test Pilots, Symposium, 25th, Beverly Hills, CA, Sept. 23-26, 1981.) Society of Experimental Test Pilots, Technical Review,* vol. 16, no. 2, 1981, p. 182-197.

The evolution and capabilities of the F-15 synthetic aperture radar (SAR) as an aid to all weather interdiction capabilities are discussed. The radar has eight components and a 384K memory, with Doppler beam sharpened (DBS) and air-to-ground capability. DBS involves cutting the radar beam into azimuth elements and a processing detection filter in each element; range/azimuth resolution is 250 ft. Design goals of 8.5 ft resolution involve the application of coherent processing, which is the SAR. The antenna senses a point on the ground for a predetermined period of time to produce the required synthetic aperture. The 8.5 ft resolution SAR is currently operational for bombing target identification. D.H.K.

A82-14939 **F/A-18 roll rate improvement program.** M. J. Tkach (McDonnell Aircraft Co., St. Louis, MO). *(Society of Experimental Test Pilots, Symposium, 25th, Beverly Hills, CA, Sept. 23-26, 1981.) Society of Experimental Test Pilots, Technical Review,* vol. 16, no. 2, 1981, p. 198-202.

The roll rate improvements made during the F/A-18 Full Scale Development Program are reviewed. Detection of low wing stiffness and high aerodynamic damping led to thickening the web and caps of the aft main spar and adding additional layers of composites to the skin aft of the main torque box. Roll power was increased by extending the aileron span, implementing differential edge flaps, and increasing the differential tail authority. Steady state roll at altitudes above 10,000 ft resulted. Differential leading edge flaps were then added to prevent roll rate decay at lower altitudes. A position stick will replace the current force stick to allow the F/A-18 to exceed the time-to-bank requirements throughout the flight envelope. D.H.K.

A82-14940 **AV-8B technical update - Leading edge root extension development.** C. A. Plummer (McDonnell Douglas Corp., St. Louis, MO). *(Society of Experimental Test Pilots, Symposium, 25th, Beverly Hills, CA, Sept. 23-26, 1981.) Society of Experimental Test Pilots, Technical Review,* vol. 16, no. 2, 1981, p. 203-209.

The effects of leading edge root extensions (LERX) on the instantaneous turn rate of the AV-8B aircraft are investigated. The LERX was 5.5 ft long with an 11 ft span and an anhedral of 11 deg; the planform comprised 7.5 sq ft/side, for a net gain of 15 sq ft, a net weight of 150 lb, and a shift of the center of gravity by 0.5%. A total of forty-four test flights carrying various weaponry configurations were conducted for data on the full flight envelope. V/STOL, cruise speed, fuel efficiency, maximum speed, and dynamic stability and control were either unchanged or beneficially affected. Buffet was reduced and instantaneous turn rate increased 21%, although some decrease in longitudinal stability was noted. A reduction of the all-composite LERX to 4.2 ft/side lowered the turn rate increase 17% and kept the decrease in longitudinal stability to 2.5%, which was acceptable. D.H.K.

A82-14946 † **Safety of helicopters in flight (Bezopasnost' poletov vertoletov).** A. M. Volodko. Moscow, Izdatel'stvo Transport, 1981. 224 p. 21 refs. In Russian.

Safety-related aspects of single-rotor and coaxial helicopter operation are summarized with reference to aerodynamics, flight dynamics, aeroelasticity, vibrations and dynamic strength of structures, performance of gas-turbine engines and automatic control systems, reliability, crew performance, and aeronautical meteorology. The physical meaning of the principal flight restrictions contained in the flight manual is examined, and possible errors are discussed. Finally, special situations involving complicated flight conditions and equipment failure are discussed along with recommendations on flight safety and accident investigation. V.L.

A82-14952 **U.S. Navy life support development trends.** D. N. DeSimone (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 1-4.

The methodology and trends in navy aircrew life support research and development are reviewed. Life support and survival gear are complementary between all services where flight, safety, escape, or survival functions may overlap. The hardware and procedural use development of any component undergoes exploratory development, advanced development, and advance engineering development before deployment. Research and development activities are initiated to respond to high accident rates, crew member functional constraints, POW reports, and updated logistics systems. Programs currently exploring improvements in environmental and escape systems, fixed seating, parachutes with no maintenance, protective clothing, survival and rescue, and physiological standards for equipment are described. M.S.K.

A82-14953 * **Emergency in-flight egress for general aviation aircraft.** L. J. Bement (NASA, Langley Research Center, Hampton, VA). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 16-24.

A NASA program for development of an inflight egress system for the left (pilot) door of general aviation aircraft is described. The pyrotechnic release door was felt to be necessary because of pilot difficulty in reaching the right door when subjected to spin/stall centrifugal effects. A flexible, linear shaped charge of hexanitrostibene II and a lanyard actuated detonator are discussed, along with mock-up tests and instrumentation. The egress system was designed for minimum structural impact, minimum pilot initiation procedures, low weight, and no egress interference, and to provide sufficient force to blow off the door, have low required maintenance, and high reliability. Results of 68 tests are reviewed, noting the inclusion of a screen to keep glass fragments from spraying the cabin.

Certification was achieved, and uses in the F-111 and B-1 aircraft are noted. M.S.K.

A82-14954 * Operational evaluation of thunderstorm penetration test flights during project Storm Hazards '80. G. L. Keyser, Jr., P. L. Deal, B. D. Fisher, and N. L. Crabill (NASA, Langley Research Center, Hampton, VA). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 44-49.

The National Aeronautics and Space Administration is conducting a research project called Storm Hazards '80 in order to study the prediction, detectability and avoidance of the hazards of severe storms for aircraft operations. The project, using a highly instrumented NASA F-106B airplane to penetrate thunderstorms, gathered and correlated data from both airborne and ground based instrumentation. The objectives of this project are to determine the effects of lightning on the design and operation of aircraft composite structures and digital electronic systems. The data will be used to determine the correlation of lightning hazards with other severe storm hazards, such as heavy precipitation, hail, turbulence and wind-shear, in order to develop an initial data base for use in design and avoidance. The NASA F-106B was equipped with a weather radar, stormscope, lightning measurement instrumentation and air sampling equipment. This paper will focus on the operational aspects of thunderstorm penetrations and the pilot techniques used to avoid the extremely hazardous portions of the storm such as the tornadoes and hail. It will deal with the effects of the storm elements on the aircraft hardware, avionics and the crew. (Author)

A82-14955 Testing of the SJU-5A ejection seat for the F/A-18 /HORNET/ aircraft. T. A. Pavlik (U.S. Naval Air Systems Command, Washington, DC) and B. Macnab (Martin-Baker Aircraft Co., Ltd., Uxbridge, Middx., England). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 62-65.

Results of developmental testing of the F/A-18 ejection seat are discussed. Changes which were required to the basic configuration MK 10 seat included standard U.S. materials and processes, environmental sealing of the mechanical devices, redundancy of critical components, single point safety handling, incorporation of a navy seat kit, oxygen, and restraint system, and incorporation of parachute water pockets. Difficulties encountered due to the intercontinental distribution of production and testing sites are outlined, and the parachute, pyrotechnic device, and survival kit are considered, noting that testing comprised 14 ejections at speed from 0-600 knots. The seat is now standard equipment on the F/A-18. M.S.K.

A82-14956 Rescue at sea. R. G. Eberhardt (U.S. Naval Weapons Center, Parachute Systems Dept., China Lake, CA). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 66, 67.

The Sea Water Activated Release System (SEAWARS) Program has the objective of reducing the number of aircrew-member drownings that occur after a successful ejection and parachute descent into the ocean. This paper addresses the historical evolution and development of the SEAWARS Program, a brief overview of the system requirements, preliminary Navy evaluation, and current program status. (Author)

A82-14958 'Little people' problem /MA-2 torso harness/. V. M. Voge (U.S. Navy, Naval Safety Center, Norfolk, VA) and H. Pheeny (U.S. Naval Weapons Center, China Lake, CA). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 76-79.

Changes necessary to the MA-2 torso harness to accommodate use by smaller people, notably females, are described. Measurements of flying personnel weighing less than 140 lb and shorter than 66 in. resulted in a decision to keep the between-K-fitting-distance at a minimum of 7.5 in., which serves as a disqualification level. An adjustable cinch strap has been added to the leg straps to compensate for people who are big enough, yet experience difficulties with proper fitting. Best fit requirements are presented, noting that people who cannot be fit with a standard harness are candidates for custom-fit harnesses. Research into a nylon system with greater negative and lateral g restraint features is indicated. M.S.K.

A82-14960 Automatic parachute releasers for premeditated parachuting. E. Puskas (Para-Flite, Inc., Pennsauken, NJ). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 84-86.

This paper is presented to inform members of the organization of the state of the art of 'Automatic Parachute Opener' design, specifically the design of those used for premeditated parachuting. This presentation covers the history, the philosophy used in establishing design parameters, the technical differences in design dictated by specific applications, the description and the differences in technology of the two primary design approaches currently in use, current trends in utilization, and direction that development of these devices will take in the foreseeable future. (Author)

A82-14961 The history of the development of the GQ aeroconical parachute - 1971-1980. A. J. Harrison (GQ Defence Equipment, Ltd., Woking, Surrey, England). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 93-96.

Development and testing of the GQ aeroconical parachute, which is used to all variants of the MK 10 ejection seat, are reviewed. The chute has a 36 in. diameter vent, equalling 18% of the flying diameter. Two 11.7 sq ft panels positioned to the rear of the canopy at a 45 deg angle from the axis of symmetry allow a positive forward gliding component. Details of the structural materials are presented, and 55 medium/high speed trial drop tests are described. A 20.3 ft/sec rate of descent is provided by the chute, a rate which is not necessarily affected by torn seams. Results of ejection seat tests are provided, noting functional success at Mach 0.98 at 14,000 ft with a maximum deceleration of 26.6 g. The chute inflates within 1.22 sec, deployment occurs at 64 ft/sec, and water pockets are included in the design to collapse the chute within 5 sec of a water landing. M.S.K.

A82-14963 A new safety harness for mobile aircrew. D. C. Reader (USAF, School of Aerospace Medicine, Brooks AFB, TX). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 106-109.

A safety harness for mobile crewmembers in both fixed and rotary winged aircraft has been designed. It consists of a self-tightening assembly of straps attached to a life preserver which is attached to an aircraft strong point by a strap with length adjustment. The safety harness has been assessed for comfort, compatibility with other items of aircrew equipment, strength in suspension and drop tests, and is now recommended for service trial. (Author)

A82-14965 Further test results of parachutes with automatic inflation modulation /A.I.M./. D. B. Webb (Irvin Industries Canada, Ltd., Fort Erie, Ontario, Canada). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 116-123.

An automatic inflation modulation canopy for the next generation of ejector seats is described. The parachute features the use of unidirectional Kevlar stretch fabric in the crown area of the canopy and an auxiliary parachute inside the main canopy mouth. The intent is to reduce the overall recovery flight path distance with a lower peak opening force. A network of reefing lines are organized, i.e. kept from tangling, by a central marquisette, which is held at a fixed point in the center of the canopy by a positioning line connected to the center point of the canopy. Whirl tower, overinflation and descent control, and deployment tests results are reported, and a 29.6 ft diam parachute was shown to display overinflation control, steady state stability, and consistency of inflation timing at speeds up to 275 knots at 16,000 ft. M.S.K.

A82-14966 **A look at the Hoffman Triangular parachute - The first successful glidable parachute.** D. Gold (U.S. Naval Weapons Center, Parachute Systems Dept., China Lake, CA). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 124-131.

The development of the Hoffman Triangular parachute is described. Several designs were considered and a cloverleaf configuration with a 25 ft canopy was chosen. A short skirt opposite a lineless tail allowed for an increase in the glide velocity of the canopy. The pilot parachute also featured four vanes, a springless elastic container flap system to throw the chute away from the jumper, and rubber bands to retain bighted suspension lines in the container. The company that produced the parachute failed in business but the use of the rubber bands to retain the suspension lines became a standard feature of parachute containers. M.S.K.

A82-14972 **Evaluation of a selected group of anti-exposure garment configurations for their effects on the operational performance and survival of Naval aircrewmen.** S. M. Reeps, D. C. Johansen, and L. J. SantaMaria (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 183-191.

A82-14974 **Test and evaluation of improved aircrew restraint systems.** G. T. Singley, III (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 196-201. 7 refs.

U.S. Army aviation accident data shows that a majority of all injuries in attack helicopters could have been avoided if these aircraft had been equipped with crashworthy seat and restraint systems. The compactness of the cockpit and the close proximity of mission equipment to the aircrew in attack and scout helicopters pose serious crash impact hazards. Although not desirable from a crashworthiness standpoint, operational considerations may dictate that mission equipment and structure be located within the occupant's crash impact motion envelope. Given this situation, it is critical to the occupant's crash impact survival chances that he be provided with a restraint system that minimizes his crash impact motion envelope, particularly for his head. The cockpit can be delethalized further when the improved restraint is complemented by padding potential strike surfaces in the cockpit, making contact surfaces frangible, and providing weapon system sights with frangibility, telescoping, and/or swingaway features. This paper presents the results of an effort to test and compare the potential of several aircrew restraint systems to reduce the crash impact motion envelope of helicopter aircrewmen. (Author)

A82-14975 **Design of a crashworthy crew seat for the Boeing Vertol Chinook helicopter.** R. F. Campbell (Boeing Vertol Co., Philadelphia, PA). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 202-208.

The design and test results of a crashworthy seat for the Chinook are presented. Requirements for the seat included the ability to withstand a crash pulse of 30 g peak with a 50 fps velocity change, and a vertical pulse of 48 g peak with a 42 fps velocity change, based on a 0.065 sec pulse duration. An armored bucket capable of protecting against a 30 cal projectile at 100 m was fabricated, and three adjustable attenuator wires were added, each sized to stroke at 600 lb over the seven in. minimum stroking distance. Features of the support structure, the armored Kevlar bucket, cushions, restraints, and testing procedures are outlined, and current work on a self-adjusting, infinitely variable attenuator is indicated, as a means to provide a constant inertia system. M.S.K.

A82-14976 **Crashworthy military passenger seat development.** L. Domzalski (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 209-215. 11 refs.

The performance criteria, design concepts, and test results for Navy crashworthy, fixed-wing aircraft passenger seats are reviewed. Noting the enhanced crashworthiness of a rearward-facing seat, crash pulses with 30 deg pitch, 19 deg roll, and 30 deg yaw are mentioned as dynamic test criteria. Ultimate static loading factors are defined, and the lack of velocity change data from accident investigation reports is stressed as a deficiency. A two passenger seating arrangement with a total weight of 55 lb was chosen, and included a double harness/lap-belt configuration. A steel bench able to withstand a velocity change of 64 fps while supporting two 250 lb passengers resulted, with a maximum energy absorber force setting of 3000 lb on the leg struts. Tests of the seat showed a resistance to up to 8 g force (4000 lb), about half the requirements, and indicate a need to redesign to comply with rearward and lateral static load/deflection criteria. M.S.K.

A82-14977 **HASEP - Survival from crashed Navy helicopters.** J. Micciche (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA) and J. J. Iatesta (Sanders and Thomas, Inc., Pottstown, PA). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 216-220. 6 refs.

The Navy's Helicopter Aircrew Survivability Program (HASEP) was originally planned to enhance the inflight recovery and survival capability for helicopter aircrewmen. HASEP, more recently, has been directed to eliminate inflight recovery. It focuses on the survival technologies with high near term payoff. The currently active technologies are discussed, taking into account the H-46 helicopter emergency flotation system, the helicopter emergency egress lighting system, a comparison of underwater helicopter escape lights, the H-46 crashworthy cargo restraint, a crashworthy troop seat integration for H-46, and an automatic life raft system. G.R.

A82-14978 **Analysis of escape systems at 687 KEAS.** D. T. Ther and R. F. Yurczyk (Boeing Military Airplane Co., Seattle, WA). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 221-225. Contract No. F33615-79-C-3406.

Attention is given to the Advance Ejection Seat program which was concerned with the selection of deployable aerodynamic devices to reduce the acceleration levels of an ejection seat. The object of this program was to find a configuration which could operate at a dynamic pressure of 1600 psf and satisfy the acceleration requirement of MIL-S-94798. Estimated aerodynamic coefficients were used in a three degree of freedom simulation to select a set of configurations which seemed sufficiently promising to be analyzed in a wind tunnel. Refined aerodynamic coefficients were obtained from wind tunnel tests and these data were used in the simulation to select the final configuration. The simulations show that improvement of seat acceleration performance is a complex problem which is not solvable by simply reducing drag. It was found that control of seat attitude and stability is essential to good acceleration performance. G.R.

A82-14979 **Wind tunnel tests of ejection seat for high dynamic pressure escape.** J. O. Bull and R. F. Yurczyk (Boeing Military Airplane Co., Seattle, WA). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 226-230. USAF-supported research.

In connection with the employment of the currently used, multimode, rapidly sequenced ejection system, it was found that a higher injury and fatality rate resulted from more ejections at high speed. A program was initiated to evaluate advanced ejection seat concepts for escape in the high dynamic pressure regime (1600 PSF or 687 KEAS). A description is presented of the wind tunnel test phase of the program. Wind tunnel data were obtained on 12 high Q ejection seat configuration variations. Complete six component data were obtained throughout an angle of attack, angle of yaw, and Mach number range to obtain a basis for conducting six-degree-of-freedom computer simulations of ejection seat stability, trajectory, and performance characteristics. Based on a preliminary review of the data, a seat with 18 deg boom and stabilizer and a seat with 18 deg boom and stabilizer plus a flow diverter appear to be the most viable candidates for the high Q ejection seat. G.R.

A82-14980 **Performance assessment of the ACES-II ejection seat-A-10 configuration.** E. O. Roberts (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 231-234.

A brief overview is presented of a performance analysis of the ACES-II ejection seat for the A-10 aircraft. The analysis is conducted with the aid of a computer simulation program, called SAFEST, which stands for Simulation and Analysis of In-Flight Escape System Techniques. A comparison between track test results and the computer simulation has shown very good simulation. This correlation indicates that complete simulation has now been realized. The obtained results can be used to design and develop new and improved escape systems at lower costs. The analysis proves the value of computer simulation in the design and the evaluation of ejection seat systems. G.R.

A82-14981 **Post ejection survival.** B. Limbrey (Martin-Baker Aircraft Co., Ltd., Uxbridge, Middx., England). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 235-238.

The causes of fatalities occurring during escapes involving ejection seats are examined. It is found that 62% of fatalities were due to striking the ground before the parachute had time to develop. The second principal cause of fatality is drowning or lost at sea, presumed drowned (25%). The remaining causes of fatality are many and varied and each makes up only a very small proportion of all fatalities. Approaches are discussed for aiding the aviator who descends on his parachute into the sea. Attention is given to fatalities occurring in the cases of a single point parachute release and a multiple parachute release. It was found that the number of fatalities for single point releases was much smaller than for multiple releases. G.R.

A82-14982 **Terrain actuated deployment system.** J. K. Seitler (ARO Corp., Buffalo, NY). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 239-244.

A description is presented of a radar altimeter which was developed to automatically detect when an ejectee, after man-seat separation, and a five second delay reaches a height of 500 through 100 feet above the terrain. The radar altimeter then triggers the deployment of the survival kit and subsequent inflation of the life raft contained in the survival kit. The radar altimeter uses a solid-state transmitter and a tuned RF receiver at the transmitter frequency. Sufficient sensitivity and selectivity is assured by RF amplification and filtering. The video processing and timing circuits process received terrain echos only if they exceed the threshold level and are associated with heights of from 100 to 500 feet. G.R.

A82-14983 **A system safety program for aircraft production and deployment.** L. E. Rackley (General Dynamics Corp., Fort Worth, TX). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 245-249.

Changes are sometimes made to an aircraft without adequate consideration of system safety or other specialty engineering aspects. An investigation is conducted concerning the implementation of suitable approaches for avoiding such a neglect with respect to vital system characteristics. It is found to be important that system safety is also considered during design changes made after fleet deployment. System safety considerations should have a significant effect on the decision making process of implementing the change. In order to follow the given recommendations, however, it will be necessary to establish an adequate system safety data base during the development phase and maintain it through the production phase and as long after fleet deployment as necessary. G.R.

A82-14984 **A ballistic design model for initiators for aircraft personnel escape systems.** B. E. Paul (SCOT, Inc., Downers Grove, IL). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 250-252.

In a review of the T-38 interseat sequencing system, it was found that more information was needed regarding the pressure history in an initiator system. In response to this observation, a ballistic model was developed which characterizes the entire pressure-space-time function in the initiator. The model was applied to two diverse initiators. The correlation was found to be quite good. The model was also applied to conditions which yielded rather high in-tube peak pressures, and predicted a similar occurrence. It was then used to establish a method for improvement of this condition. It appears that the model can be efficiently utilized for the development of any new initiator system or the modification of current systems. The model is capable of handling layouts with multiple branches and/or multiple initiator sources. G.R.

A82-14985 **Analytical and experimental characterization of the JAU-14/A cartridge actuated initiator for use in aircrew escape system performance evaluation.** A. M. Varney, R. J. Brandstadt, J. D. Martino (Applied Combustion Technology, Inc., Orlando, FL), and J. L. Hinds (U.S. Navy, Naval Ordnance Station, Indian Head, MD). In: Survival and Flight Equipment Association, Annual Symposium, 18th, San Diego, CA, October 12-16, 1980, Proceedings. Canoga Park, CA, Survival and Flight Equipment Association, 1981, p. 253-255.

A82-14998 † **The technology of sheet-metal stamping in the production of aircraft /2nd revised and enlarged edition/ (Tekhnologiia zagotovitel'no-shtampovochnykh rabot v proizvodstve samoletov /2nd revised and enlarged edition/).** M. N. Gorbunov. Moscow, Izdatel'stvo Mashinostroenie, 1981. 224 p. 43 refs. In Russian.

The general characteristics of sheet-metal stamping operations are discussed, followed by a detailed description of the individual stamping procedures. This includes the location and spacing of blanks, and means of improving the quality of the cutting edge. The bending method is then described, including a discussion of the stress-strain state, the minimal radius of bending, bending with tangential tension and compression, and bending with radial compression. The flanging and expansion processes are discussed, as is stretch-wrap forming, molding, and die forging. Attention is also given to the stamping of more complicated shapes and to other methods of stamping in the production of aircraft. J.F.

A82-15311 **Prediction and performance of radome-covered reflector antennas.** P. J. B. Clarricoats, C. G. Parini, and M. S. A. S. Rizk (Queen Mary College, London, England). *(International Union of Radio Science, Symposium on Electromagnetic Waves, 10th, Technische Universität München, Munich, West Germany, Aug. 26-29, 1980.) Radio Science,* vol. 16, Nov.-Dec. 1981, p. 1105-1110. Research supported by the Science Research Council.

The return loss (reflection coefficient) of a paraboloidal radome is predicted by a physical optics method based on the power-coupling theorem. An asymptotic form of the reflection coefficient is found to be very accurate and consistent with a simple geometric optics interpretation. A method to reduce the return loss is investigated using a hemispherical iris-loaded sandwich section of the center of the radome, and an improvement of approximately 5 dB is observed over a useful frequency bandwidth. Contributions of the radome to the radiation pattern of the antenna are identified, and those near to boresight are predicted. D.L.G.

A82-15468 # **A criterion for determining the causes of wind shear at Punta Raisi Airport, on the basis of statistical data from barograph records (Ricerca di un criterio per la determinazione delle**

cause del wind-shear verificatosi nell'aeroporto di Punta Raisi attraverso i dati statistici rilevati da registrazioni barografiche). O. Cosentino (Aeronautica Militare, Servizio Meteorologico, Rome, Italy) and G. Ferlazzo (Palermo, Università, Palermo, Italy). *Rivista di Meteorologia Aeronautica,* vol. 41, Apr.-June 1981, p. 127-135. 7 refs. In Italian.

A statistical analysis has been conducted on pressure jumps appearing in the barograph records of Punta Raisi airport, which are compared with such corresponding meteorological parameters as wind, temperature and humidity in order to determine the synoptic, local and orographic causes of the phenomena. Attention is given the characteristics and causes of wind shear in the geographical context of the airport, and it is concluded that prefrontal or frontal pressure variations accompanied by local elevation phenomena with cumulus clouding result in horizontal wind shear over the area in which barometric jumps are experienced. O.C.

A82-15482 † **Study of the load-carrying capacity of aviation gas-turbine engine impellers under low-cycle loading at normal and high temperatures (Issledovanie nesushchei sposobnosti rabochikh koles kompressorov aviatsionnykh GTD pri malotsiklovom nagruzhenii v usloviiakh normal'noi i povyshennykh temperatur).** V. G. Bazhenov, A. D. Baliuk, B. G. Reznik, and V. P. Gontarovskii (Kievskii Politekhnicheskii Institut, Zhitomir, Ukrainian SSR). *Problemy Prochnosti,* Nov. 1981, p. 45-48. In Russian.

A rotor was designed for testing the impeller of gas-turbine engines under low-cycle loading, considering the force interaction of neighboring stages. The stress-strain state of a disk of an impeller was calculated by means of an algorithm based on the finite element method and the theory of small elastoplastic deformations. The load-carrying capacity of the impeller is estimated under conditions approximating those found in a real operational environment. J.F.

A82-15596 **Direct free-flight analysis of aircraft dynamics at high angles of attack.** M. E. Beyers (South African Council for Scientific and Industrial Research, National Institute for Aeronautics and Systems Technology, Pretoria, Republic of South Africa). *Aeronautical Society of South Africa and South African Institute of Aeronautical Engineers, Journal,* vol. 2, no. 1, 1981, p. 17-28. 26 refs.

Concepts are examined for the analysis of high-maneuverability aircraft dynamics on the basis of gross flight-dynamic effects observed in wind-tunnel free-flight experiments. Experimental and analytical techniques developed to study the generic nonoscillatory free-flight motion of flight vehicles trimmed at significant angles of attack, are reviewed. The feasibility of aircraft model free-flight tests is demonstrated on the basis of simulations and trajectory validation schemes are proposed for the corroboration of free-flight and captive-model dynamic data. Finally, the rationale underlying the utilization of data gathered in captive- and free-model dynamic stability tests of high-performance aircraft is examined in the context of design objectives of high maneuverability and good flying qualities. (Author)

A82-15597 **A matter of seconds - A critical account of three notable air disasters /5th Major Miller Memorial Lecture/.** C. S. Margo. *Aeronautical Society of South Africa and South African Institute of Aeronautical Engineers, Journal,* vol. 2, no. 1, 1981, p. 30-35.

Three aircraft accidents are analyzed for causes and remedies. A DC-10 crash of May 25, 1979, comprised the loss of an engine on take-off and subsequent loss of control leading to grounding 31 sec later. Continued unsymmetric repair, maintenance, and replacement of the engines from one side or the other had led to structural failure, and loss of control occurred in the absence of stall indication and power from the side of the lost engine. An increase of speed is judged to have been capable of preventing the crash. Although little evidence was left after the accident that killed Dag Hammarskjold, an evaluation is given that the pilot's knowledge of the height above sea level was uncertain. Finally, a crash of a Boeing 707 on April 20, 1968 is determined to have happened because of premature transition from take-off to climb power. It is noted that the pilot had had a total of one hour's experience with that particular version of the 707. M.S.K.

A82-15599 **Computer image generation for flight simulation.** B. J. Schachter (Westinghouse Defense and Electronics Systems Center, Baltimore, MD). *IEEE Computer Graphics and Applications,* vol. 1, Oct. 1981, p. 29-32, 34-38, 40-46 (17 ff.). 130 refs.

The features and capabilities of computer image generation for producing effective imagery for flight simulation are explored. CRT operational parameters designed to meet necessary realism for human visual interaction are outlined, noting the eye's tendency to concentrate on one small area of resolution at a time. Four currently available systems are examined, along with control logic, the NASA three-view space flight simulator, and block diagrams of information routing. VLSI processors, holographic image displays, interactive computer graphics, and optical disks are considered for advanced simulator systems. M.S.K.

A82-15606 **Experimental investigation of total pressure loss and airflow distribution for gas turbine combustors.** Z.-M. Fan and Z.-F. Chao (China Gas Turbine Research Institute, People's Republic of China). *(Journal of Engineering Thermophysics,* vol. 1, May 1980, p. 185-194.) *Engineering Thermophysics in China,* vol. 1, Apr.-June 1980, p. 207-217. Translation.

Results of theoretical and experimental investigations are presented to demonstrate the feasibility of a solution for certain one-dimensional simultaneous equations. The current flow drag method and the hole blanketing experimental method are shown to have difficulties, and a simple technique of calculation using the mean flow coefficient is provided. Results of calculations in accordance with the one-dimensional flow simultaneous solution are compared with those obtained with the mean flow coefficient method and experimental results, showing good agreement. D.L.G.

A82-15625 **Large terminal maneuvering areas: Operational problems - Possible development of solutions (Les grandes zones de manoeuvre terminale: Problèmes opérationnels - Evolution possible des solutions).** J.-L. Garnier (Direction de la Navigation Aérienne, Paris, France). *(Organisation Européenne pour l'Equipement Electronique de la Navigation Aérienne, Forum Technique, Rome, Italy, May 15, 1981.) Navigation* (Paris), vol. 29, Oct. 1981, p. 443-451. In French.

The operational problems associated with large terminal maneuvering areas (TMAs) are examined, and means by which these problems may be alleviated by the use of expected technological advances are considered. The TMA is defined as the region of space occupied by flights departing from or having a destination in the area concerned, within which aircraft are climbing towards or descending from their cruise levels. Means currently in use for the management of air traffic within a TMA such as that of Paris are indicated. Current problems arising in the use of TMAs are attributed to the phenomena of high traffic levels and the necessity of standbys in the presence of the competing priorities of large capacity and user economics. The possible contributions of the DABS selective addressing secondary radar system, MLS and precision DME to the resolution of these problems are examined, and it is concluded that while all these techniques have their place in the TMAs of the future, additional measures in the areas of onboard navigation equipment, automated ground assistance and traffic control systems are required. A.L.W.

A82-15655 † **Current aerial cameras (Sovremennye aerofotoapparaty).** V. G. Afremov and V. B. Il'in. *Geodeziia i Kartografiia,* Oct. 1981, p. 40-42. 6 refs. In Russian.

The paper considers the development and operation of the TE and TES aerial cameras, having focal distances of 350, 100, 70, and 50 mm and FOV angles of 40, 103, 120, and 136.5 deg, respectively, for 18 x 18 cm frames. The basic technical characteristics and some applications of these cameras are presented. B.J.

A82-15721 † **Quality optimization and unification of aviation gasolines (Optimizatsiia kachestva i unifikatsiia aviatsionnykh benzinov).** V. E. Emel'ianov, K. A. Demidenko, and B. A. Englin (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Neftianoi Promyshlennosti, Moscow, USSR). *Khimiia i Tekhnologiia Topliv i Masel,* no. 11, 1981, p. 18, 19. In Russian.

The introduction of a new process for the production of aviation gasolines based on reformed gasoline has made it possible to optimize the quality of aviation gasolines with respect to their chemical stability, tar content, iodine number, and the content of an antioxidizer. The principal properties of gasolines B-91/115, B-95/130, and B-100/130 are briefly reviewed. It is proposed to replace the aviation gasolines currently in use with a single gasoline type, B-91/115, with an octane number of not less than 95. V.L.

A82-15723 † **Optimization of requirements on the pitting-prevention properties of turbojet-engine oils (Optimizatsiia trebovanii k protivopittingovym svoistvam masel dlia turboreaktivnykh dvigatelei).** B. S. Gutenev, A. V. Vilenkin, G. T. Novosartov, V. G. Gorodetskii, and B. F. Kirdakov. *Khimiia i Tekhnologiia Topliv i Masel*, no. 11, 1981, p. 30, 31. 5 refs. In Russian.

Analysis of the operating conditions of bearings in turbojet engines shows that the probability of trouble-free bearing service is reduced with increasing temperatures and loads. In order to increase the service life of turbojet-engine bearings, a study has been carried out with the aim of improving the pitting-prevention properties of MS-8p oil. This objective has been achieved by substituting a chlorine-containing additive for a phosphorus-containing additive. V.L.

A82-15724 † **Efficient use of working fluids in aviation hydraulic systems (Ratsional'noe primenenie rabochikh zhidkostei v aviatsionnykh gidravlicheskikh sistemakh).** B. G. Sedrik, V. S. Ugriumov, and A. F. Iakovleva. *Khimiia i Tekhnologiia Topliv i Masel*, no. 11, 1981, p. 33-35. In Russian.

Changes in the quality of working fluids in the hydraulic equipment of aircraft in the process of equipment operation are analyzed. It is shown that by scheduling fluid replacement with allowance for the actual condition of the fluid, it would be possible to reduce fluid consumption by 1.5-2 times without a tradeoff in equipment reliability. V.L.

A82-15748 **A VHF homing system with VHF radio-telephony for area-representative strip-survey flights conducted, as part of combined forest inventories, with light aircraft carrying 70 mm and 35 mm cameras (Ein VHF-Homing-System mit VHF-Sprechfunk für flächenrepräsentative Streifenbefliegungen mit 70 mm und 35 mm Kameras von leichten Flugzeugen im Rahmen kombinierter Waldinventuren).** B. Rhody (Bundesforschungsanstalt für Forst- und Holzwirtschaft, Hamburg, West Germany). *Bildmessung und Luftbildwesen*, vol. 49, Nov. 1, 1981, p. 199-203. In German.

A82-15816 **Computer-animated predictive displays for microwave landing approaches.** S. N. Roscoe (New Mexico State University, Las Cruces, NM) and R. S. Jensen (Ohio State University, Columbus, OH). *IEEE Transactions on Systems, Man, and Cybernetics*, vol. SMC-11, Nov. 1981, p. 760-765. 55 refs.

It is shown that a safe, orderly, and economical flow of air traffic at congested metropolitan airports can be ensured by microwave radio guidance systems. By furnishing aircraft position in three dimensions, these terminal navigation aids potentially allow steeply curved landing approaches that will faciliate unprecedented noise abatement procedures, large fuel savings, and precisely timed arrivals at airport runways. To implement such complex flight procedures, a combination of semiautomatic computer-assisted airplane guidance and control and radically different flight displays will be required if pilots are to monitor such maneuvers confidently and execute them manually when necessary. Results of a simulator investigation, involving visual guidance and flight-path prediction embedded in computer-animated contact analog displays, show that pilots can reliably execute computer-programmed curved approaches to airport runways with the required precision in the face of severe wind shears. C.R.

A82-15823 **The influence of wind shear and vertical winds on takeoffs and go-arounds.** R. König and P. Krauspe (Braunschweig, Technische Universität, Braunschweig, West Germany). *Airport Forum*, vol. 11, Oct. 1981, p. 43-46. 8 refs.

The effects of wind shear and vertical winds on aircraft takeoffs and go-arounds is discussed. It is noted that with the advent of a more modern autopilot generation and advanced wind shear warning indicators, landing accidents due to wind shear will be avoidable. Hazards posed by low-velocity downdrafts and wind shear in the lee of a large-surface obstacle are also considered with reference to studies made a a German airport and with simulators. Operational considerations of wind shear are assessed. S.C.S.

A82-15824 **'In situ' composites for jet propulsion and stationary gas turbine applications.** W. Bunk (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Werkstoff-Forschung, Cologne; Aachen, Rheinisch-Westfälische Technische Hochschule, Aachen, West Germany) and P. R. Sahm (Aachen, Rheinisch-Westfälische Technische Hochschule, Aachen, West Germany). *Zeitschrift für Werkstofftechnik*, vol. 12, Oct. 1981, p. 345-359. 25 refs. Research supported by the Bundesministerium für Forschung und Technologie.

Examples of reinforced superalloys for high temperature applications in jet engines are reported. The phase stability of microstructures is tested with a high thermal gradient device, and first engine tests of directionally solidified Co-Cr7C3 eutectic alloy are reported. Properties such as creep behavior, fatigue, and oxidation resistance are measured and compared with corresponding data for both conventionally and directionally cast Ni-base superalloy IN 738. First engine tests of 18,000 hrs with unalloyed Co-Cr7C3 vanes indicate the importance of a fully eutectic microstructure and stability against carbide transformations. D.L.G.

A82-15827 **Rapid elliptic solvers.** R. W. Hockney (Reading, University, Reading, Berks., England). In: Numerical methods in applied fluid dynamics. London and New York, Academic Press, 1980, p. 1-48. 37 refs.

Rapid direct methods for the solution of certain classes of elliptic partial differential equations (pde) have been in use for over ten years. Such methods are based on Fourier analysis, cyclic reduction, and optimal combinations of the two. To classify as a Rapid Elliptic Solver (RES), the algorithm must solve the elliptic equation of an (n x n) mesh in a number of floating-point arithmetic operations which corresponds approximately to the source of n. The methods are also characterized by the minimum use of storage. A number of different RES algorithms for the solution of pde's are considered, taking into account questions concerning the choice of algorithm, the method of Fourier Analysis and Cyclic Reduction (FACR), the cyclic reduction process, marching methods, and a comparison of programs. Attention is also given to nonseparable equations, and the N-body problem. G.R.

A82-15835 **Remarks on the calculation of transonic potential flow by a finite volume method.** A. Jameson (New York University, New York, NY). In: Numerical methods in applied fluid dynamics. London and New York, Academic Press, 1980, p. 363-386. 18 refs. Contract No. N00014-77-C-0032.

The development of a finite volume method for the numerical calculation of transonic flow is considered. It is assumed that the flow is irrotational, so that the velocity can be represented as the gradient of a potential. Essentially this limits the application of the method to flows containing fairly weak shock waves, for which the Mach number of the normal component of the velocity ahead of the shock is not substantially greater then 1.3, since shock waves are to be modelled by isentropic jumps. The formulation of the equations is discussed, taking into account the case of a wing or wing-body combination in a uniform stream. The discrete approximation to the equations is developed by using a subdivision of the domain into distorted cubic cells. The developed procedure is applied to the study of swept wings. The results of the calculations encourage confidence in the usefulness of the potential flow model for engineering predictions. G.R.

A82-15845 # **Robust flight control - A design example.** S. N. Franklin (Systems Control Technology, Inc., Palo Alto, CA) and J. Ackermann (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Dynamik der Flugsysteme, Oberpfaffenhofen, West Germany). *Journal of Guidance and Control*, vol. 4, Nov.-Dec. 1981, p. 597-605. 6 refs. Research supported by the

Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt; Grant No. AF-AFOSR-78-3633; Contract No. N00014-79-C-0424.

A novel parameter space method is used as a tool for the design of a robust stabilization system for the short-period longitudinal mode of a fighter aircraft. The example is an F-4E with additional horizontal canards. Robustness is achieved, in the sense that military specifications for damping and natural frequency are satisfied, by a constant controller in spite of perturbations. The perturbations are changing flight conditions and undetected sensor failures. The resulting controller structure requires two gyros and one accelerometer. The system, including actuator dynamics and feedback dynamics, is of sixth order and, in the design, four free controller parameters have been assumed. Practical considerations are taken into account, such as bandwidth limitation below structural vibration frequencies, actuator limitations, and relaxed emergency specifications in failure situations. A82-15846 # **Airplane performance sensitivities to lateral and vertical profiles.** J. C. Wauer, J. M. H. Bruckner (Rockwell International Corp., Cedar Rapids, IA), and C. H. Humphrey (United Air Lines, Inc., San Francisco, CA). *Journal of Guidance and Control,* vol. 4, Nov.-Dec. 1981, p. 606-613. 11 refs.

Airplane performance sensitivity to the choice of lateral and vertical profiles is studied based on data recorded on in-service flights of a 727-200 airplane equipped with JT9D-7 engines. Lateral profile performance sensitivity is based on analysis of flight technical or guidance error and on varying degrees of direct flight clearance. Vertical analysis is based on an aerodynamic simulation of the recorded flights. Sensitivity to the choice of vertical profile is studied by simulating the actual profile that was flown, two perfectly flown constant IAS/Mach profiles, and minimum-cost and minimum-fuel optimum profiles. Some of the practical considerations in implementing the real-time optimum profile algorithms and some of the difficulties encountered with the optimum profile computations are discussed. Predicted fuel and time savings are related to the air traffic control (ATC) environment experienced by the airlines to obtain net savings predictions with varying degrees of ATC restriction. A82-15847 * # **Experimental evaluation of a perspective tunnel display for three-dimensional helicopter approaches.** A. J. Grunwald (Technion - Israel Institute of Technology, Haifa, Israel), J. B. Robertson, and J. J. Hatfield (NASA, Langley Research Center, Flight Electronics Div., Hampton, VA). *Journal of Guidance and Control,* vol. 4, Nov.-Dec. 1981, p. 623-631. 11 refs.

A computer-generated perspective tunnel display for a steep and strongly curved three-dimensional helicopter approach is studied. The necessary control variables for following a curved trajectory are analyzed, the effectiveness of superimposed predictor symbology is investigated, and a suitable predictor law is formulated. The theoretical considerations are validated by an extensive fixed-base simulator program. The tunnel display with a superimposed predictor symbol is shown to outperform conventional-type displays in its abilities to follow a curved trajectory in the presence of gust disturbances, to enter the trajectory from an unknown position outside this trajectory, as well as to monitor automatic approaches. The feasibility of the tunnel display for operation in actual flight has been demonstrated in an exploratory flight test. (Author)

A82-15864 **Mathematical programming in engineering design problems.** H. J. Baier (Dornier System GmbH, Friedrichshafen, West Germany). In: Numerical optimisation of dynamic systems. Amsterdam, North-Holland Publishing Co., 1980, p. 391-410. 19 refs.

The application of mathematical programming to engineering design problems is considered. After the statement of the problem some real-world applications are discussed and some comments on the impact of mathematical programming on the engineering design process are made. Sequential unconstrained minimization technique, sequential linear programming and Lagrangian multiplier methods are presented as three important representatives of optimization algorithms in this field of application. The discussion of some special features shows what can be undertaken to improve their relative performance. Finally an assessment of these algorithms is made. (Author)

A82-15918 # **High voltage/high power for airborne applications.** F. C. Brockhurst (USAF, Institute of Technology, Wright-Patterson AFB, OH) and M. P. Dougherty (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH). *IEEE Transactions on Aerospace and Electronic Systems,* vol. AES-17, Nov. 1981, p. 795-801. 15 refs.

Advancements made in technologies required for lightweight, high voltage, high power, airborne power systems are discussed. Programs to reduce the weight of rotating machines, transformers, switches, invertors, and capacitors are described, and some aspects in the use of these components in the design of lightweight systems are considered. Interactive programs already developed allow the designer to analyze circuit performance and perform component and limited system design, while additional programs are planned with emphasis on quick response, ease of use, and versatility. A82-15950 **CT7 - GE attacks commuter turboprop market.** J. Moxon. *Flight International,* vol. 120, Nov. 21, 1981, p. 1572, 1575, 1576.

A description is given of the design features and performance capabilities of the CT7 turboprop engine, which is intended for commuter aircraft of the 30-35 seat class. The 1700 shaft horsepower engine employs a combined axial/centrifugal compressor to achieve a pressure ratio of 17:1 and turbine entry temperatures of over 1200 C. Emphasis is put on the engine's maintainability, which allows field changes of all modules with only a 12-piece standard tool kit. It is claimed that the CT7 engine core is 30% more fuel efficient than the CT58 helicopter engine core which it is scheduled to replace. The engine incorporates a centrifugal inlet separator that rejects 85-95% of all sand and dust. The reliability of the CT7 is in part due to the development and operational experience accumulated with the T700 military turboshaft, on which its design is based. O.C.

THE NUMERICAL SOLUTION OF INCOMPRESSIBLE TURBULENT FLOW OVER AIRFOILS Ph.D. Thesis

Harwood Allan Hegna 1981 168 p
Avail: Univ. Microfilms Order No. 8119139

An algebraic eddy viscosity turbulence model based on Prandtl's mixing length theory was modified for separated adverse pressure gradient flows. Finite difference methods for solving the inviscid stream function equation and the incompressible laminar Navier-Stokes equations were used. A finite difference method for solving the Reynolds averaged incompressible turbulent two-dimensional Navier-Stokes equations were employed. Solutions for a NACA 0012 airfoil at angles of attack varying from five to 11.5 degrees at a chord Reynolds number of 170.000 were obtained. Velocity profiles near the airfoil surface and surface pressure distributions are presented and compared with experimental data. Lift and drag coefficients agree well with experimental values. Dissert. Abstr.

SUBCRITICAL AND SUPERCRITICAL AIRFOILS FOR GIVEN PRESSURE DISTRIBUTION Ph.D. Thesis

Ahmed Abdelatif HassanEissa 1981 52 p
Avail: Univ. Microfilms Order No. 8121930

An effective method, based on hodograph theory, was developed for the aerodynamic design of subcritical and shock-free supercritical airfoil sections. In addition to the free-stream conditions, the input to the design procedure includes a prescription of the subsonic part of a target pressure distribution and, for supercritical airfoils, of a presumed stream function on the sonic line. A computer program carries out a number of sequential steps that result in an airfoil with a pressure distribution close to that desired at little computational cost. Thus, the airfoil designer can alter the input if design goals are not met and quickly produce another candidate airfoil. This is aided by appropriate graphic display of the airfoil and its pressure distribution. Dissert. Abstr.

AEROELASTICITY MATTERS: SOME REFLECTIONS ON TWO DECADES OF TESTING IN THE NASA LANGLEY TRANSONIC DYNAMICS TUNNEL

Wilmer H. Reed, III Sep. 1981 19 p refs Presented at the Intern. Symp. on Aeroelasticity, Nuremberg, West Germany, 5-7 Oct. 1980 - 1 Oct. 1981
(NASA-TM-83210) Avail: NTIS HC A02/MF A01 CSCL 01A

Testing of wind-tunnel aeroelastic models is a well established, widely used means of studying flutter trends, validating theory and investigating flutter margins of safety of new vehicle designs. The Langley Transonic Dynamics Tunnel was designed specifically for work on dynamics and aeroelastic problems of aircraft and space vehicles. A cross section of aeroelastic research and testing in the facility since it became operational more than two decades ago is presented. Examples selected from a large store of experience illustrate the nature and purpose of some major areas of work performed in the tunnel. These areas include: specialized experimental techniques; development testing of new aircraft and launch vehicle designs; evaluation of proposed 'fixes' to solve aeroelastic problems uncovered during development testing; study of unexpected aeroelastic phenomena (i.e., 'surprises'); control of aeroelastic effects by active and passive means; and, finally, fundamental research involving measurement of unsteady pressures on oscillating wings and control surface. EXPERIMENTAL AND ANALYTICAL STUDIES OF A MODEL HELICOPTER ROTOR IN HOVER

F. X. Caradonna and C. Tung Sep. 1981 61 p refs Presented at the 6th European Rotorcraft and Powered Lift Aircraft Forum, Bristol, England, 16-19 Sep. 1980 Prepared jointly with Army Aviation Research and Development Command
(NASA-TM-81232; A-8332; USAAVRADCOM-TR-81-A-23) Avail: NTIS HC A04/MF A01 CSCL 01A

A benchmark test to aid the development of various rotor performance codes was conducted. Simultaneous blade pressure measurements and tip vortex surveys were made for a wide range of tip Mach numbers including the transonic flow regime. The measured tip vortex strength and geometry permit effective blade loading predictions when used as input to a prescribed wake lifting surface code. It is also shown that with proper inflow and boundary layer modeling, the supercritical flow regime can be accurately predicted. J.M.S.

EVALUATION AND WIND TUNNEL TESTS OF THE 4,000 LB (NORMAL-FORCE) PITCH/YAW AND ROLL DYNAMIC STABILITY BALANCE SYSTEMS FOR MEASURING DIRECT, CROSS, AND CROSS-COUPLING DERIVATIVES Final Report, 5 Jun. 1978 - 25 May 1979

T. D. Buchanan, S. M. Coulter, and E. J. Marquart Sep. 1981 79 p refs
(AD-A105122; AEDC-TR-80-12) Avail: NTIS HC A05/MF A01 CSCL 20/4

Early in the 1970's, the personnel at the Arnold Engineering Development Center (AEDC) recognized the need for a set of new dynamic test mechanisms for testing aircraft models at high angles of attack. At these angles of attack cross and cross-coupling derivatives may be significant in determining the aircraft's stability. Dynamic balances were fabricated to perform pitch, yaw, and roll dynamic stability tests of aircraft or large missile models at AEDC. The balances were designed to measure not only the direct derivatives but also cross and cross-coupling derivatives. The set of balances comprises a 4,000-lb (normal-force) roll and a 4,000-lb pitch/yaw forced-oscillation balance to measure the direct damping derivatives and a five-component can-type balance to measure the cross and cross-coupling derivatives attributable to pitch or yaw. Extensive laboratory investigations of the balances' static and dynamic response characteristics were performed before wind tunnel tests of a 1/9-scale F-16A model in the AEDC Propulsion Wind Tunnel (16T) at Mach numbers from 0.2 to 1.4 GRA

APPLICATION OF SINGULAR PERTUBATION THEORY TO ONBOARD AIRCRAFT TRAJECTORY OPTIMIZATION Ph.D Thesis

Abhijit J. M. Chakravarty 1981 139 p
Avail: Univ. Microfilms Order No. 8121183

The problem of minimizing direct operating cost in dollars (combined cost per hour and cost of fuel per hour) for a typical commercial jet transport model is formulated via the Pontryagin minimum principle. Singular perturbation theory is applied to reduce the computational burden of solving the resulting optimal control problem. The work of previous investigators is extended to include the aircraft weight variation in the state equations and the resulting seven-state model is analyzed for time scale separation. It is shown that a realistic time scale separation involves only two scales. The resulting model is then used to develop the inner and outer solutions as dictated by singular perturbation theory. Both the free terminal time problem and the time controlled 4-D problem are considered. A comprehensive model for the aerodynamic and fuel flow terms appearing in the equations is developed for use in optimal trajectory computation. Numerical results are presented that illustrate the nature of the optimal trajectory and the control variables. Dissert. Abstr.

TRANSPORTATION SYSTEMS EVALUATION METHODOLOGY DEVELOPMENT AND APPLICATIONS, PHASE 3 Final Report

A. Robert Kuhlthau, I. D. Jacobson, and L. C. Richards Jun. 1981 82 p

(Contract NAS1-14908)
(NASA-CR-164999; UVA/528175/MAE-CE81/101) Avail: NTIS HC A05/MF A01 CSCL 01B

Transportation systems or proposed changes in current systems are evaluated. Four principal evaluation criteria are incorporated in the process, operating performance characteristics as viewed by potential users, decisions based on the perceived impacts of the system, estimating what is required to reduce the system to practice; and predicting the ability of the concept to attract financial support. A series of matrix multiplications in which the various matrices represent evaluations in a logical sequence of the various discrete steps in a management decision process is used. One or more alternatives are compared with the current situation, and the result provides a numerical rating which determines the desirability of each alternative relative to the norm and to each other. The steps in the decision process are isolated so that contributions of each to the final result are readily analyzed. The ability to protect against bias on the part of the evaluators, and the fact that system parameters which are basically qualitative in nature can be easily included are advantageous. S.L.

INVESTIGATION OF SEVERE LIGHTNING STRIKE INCIDENTS TO TWO USAF F-106A AIRCRAFT
J. Anderson Plumer Hampton, Va. NASA. Langley Research Center Sep. 1981 19 p
(Contract NAS1-15884)
(NASA-CR-165794; LT-80-56) Avail: NTIS HC A02/MF A01 CSCL 01C

The results of the inspection and analysis of two F-106A aircraft that were struck by separate lightning strikes within a few minutes of each other are presented. Each aircraft sustained severe lightning strikes to the pitot booms, resulting in extensive damage to the pitot heater power harness, number 8 ground wire, and lightning suppressors, but there was no damage to either aircraft's electrical or avionic systems. A simulated lightning current of 226 kA and 3.8 million A(2)*S was required to reproduce the damage to the ground wires in the radomes. Photographs and detailed assessments of the damage are included. R.J.F.

AN ANALYSIS OF CIVIL AVIATION PROPELLER-TO-PERSON ACCIDENTS: 1965-1979
William E. Collins, Angelo R. Mastrullo, William R. Kirkham, Deborah K. Taylor, and Paula M. Grape May 1981 13 p refs
(AD-A105365; FAA-AM-81-15) Avail: NTIS HC A02/MF A01 CSCL 01/2

The interest of manufacturing, governmental, and safety personnel using paint schemes on propeller and rotor blades is based on improving the visual conspicuity of those blades when they are rotating. While propeller and rotor paint schemes may serve to reduce the number of fatalities and injuries due to contact with a rotating blade there is little information available regarding analyses of the circumstances surrounding such accidents. Brief reports provided by the National Transportation Safety Board of all 'propeller-to-person' accidents from 1965 through 1979 were examined and analyzed in terms of airport lighting conditions, actions of pilots, actions of passengers and ground crew, phase of flight operation, weather conditions, and others. Analyses based on a total of 319 accidents showed a marked drop in the frequency of 'propeller-to-person' accidents from 1975 through 1978. Several types of educational efforts directed toward pilots and ground crew, both prior to and during that 4-year period, were examined as possible factors contributing to the accident rate decline. Accident patterns provide a basis for assessing the probable efficacy of various recommendations (including propeller conspicuity) for further reducing 'propeller-to-person' accidents. Author (GRA)

INVESTIGATION OF THE STRUCTURAL DEGRADATION AND PERSONNEL HAZARDS RESULTING FROM HELICOPTER COMPOSITE STRUCTURES EXPOSED TO FIRES AND/OR EXPLOSIONS Final Report, Mar. 1979 - Dec. 1980
Raymond J. Schiltz, Jr. Aug. 1981 111 p refs
(Contract DAAK51-79-C-0009; DA Proj. 1L1-62209-AH-76)
(AD-A104757; USAAVRADCOM-TR-81-D-16) Avail: NTIS HC A06/MF A01 CSCL 13/12

A program was undertaken to investigate the structural degradation and personnel hazards resulting from exposure of helicopter composite structures to fire and/or explosion. The program consisted of a technical survey, a test program, and an analysis phase. A major part of the technical survey was a literature survey. In addition, organizations working in the fields of interest were contacted for information, and some were visited for further, detailed discussions. The computer programs currently available for modeling enclosure fires were screened, and one was chosen for further study. The test program consisted of a series of tests on two representative helicopter structures: a sheet-stiffened, built-up door of Kevlar 49 fabric impregnated with an epoxy resin, and a honeycomb sandwich fuselage shell structure of graphite/epoxy fabric skins on a Nomex honeycomb core. The tests conducted on materials from these structures were smoke generation tests, and structural degradation tests. Ballistic tests on the complete test article were conducted to determine whether the structures would ignite under HEI impact conditions. Based on the survey and testing, design criteria for structural composite components were investigated and, when appropriate, formulated. Author (GRA)

FLIGHT EVALUATION OF LORAN-C AS A HELICOPTER NAVIGATION AID IN THE BALTIMORE CANYON OIL EXPLORATION AREA Final Report, Mar. - May 1979
William A. Lynn May 1981 43 p

(FAA Proj. 045-390-130)
(AD-A105260; FAA-CT-80-53; FAA-RD-81-27) Avail: NTIS HC A03/MF A01 CSCL 17/7

A series of flight tests were conducted to investigate the use of long range navigation (LORAN)-C as a helicopter navigation system in the offshore New Jersey Baltimore Canyon oil exploration area. Tests were flown aboard the Federal Aviation Adminstration (FAA) Technical Center's CH-53A using a Teledyne Systems TDL-711 LORAN Micro-Navigator. The purpose of the tests was to determine the accuracy and operational usability of LORAN-C for offshore en route navigation and nonprecision approaches. The total system accuracy met or exceeded the requirements of Advisory Circular (AC) 90-45A 'Accuracy Requirements of Area Navigation Systems' for terminal and en route phases of flight, provided the proper LORAN triads were selected. The LORAN-C System did not meet AC 90-45A nonprecision approach accuracy criteria. Author (GRA)

THE USE OF GROUNDSPEED, IN A WIND SHEAR AND THE FLIGHT EVALUATION OF A RADAR-ALTIMETER-BASED SYSTEM FOR THE MEASUREMENT OF GROUNDSPEED Final Report, Jan. 1978 - Oct. 1980
David Lawrence Jul. 1981 44 p refs
(AD-A104758; FAA-CT-81-34; ACT-100F) Avail: NTIS HC A03/MF A01 CSCL 04/2

The use of groundspeed in combination with airspeed has been considered and shown to be an effective aid in the execution of an approach and landing in a heavy jet transport airplane. A flight dynamics analysis shows that the response of such aircraft to sudden changes in headwind is quite sluggish, requiring more than 100 seconds for equilibrium conditions to be regained in the worst case. A feasibility demonstration model of a radar-altimeter-based system for the measurement of groundspeed has been subjected to a limited in-flight evaluation. It is a self-contained unit requiring no ground-based equipment and no on-board equipment other than the small flush transmit and receive antennas and the associated cable runs. While the current unit does not meet the desired accuracy standard (delta = + or 3 knots, or less), it approaches it at times, and greater accuracy can be achieved with further development. Responsiveness to rapidly changing groundspeed matched that of the reference inertial navigation system; and satisfactory groundspeed tracking was maintained during turning, climbing, and descending flight. THE EFFECT OF VISUAL INFORMATION ON MANUAL APPROACH AND LANDING
P. H. Wewerinke 28 Apr. 1980 20 p refs Presented at 16th Ann. Conf. on Manual Control, Cambridge, Mass., 5-7 May 1980 Abbreviated version of NLR-TR-80055-U
(NLR-MP-80019-U; NLR-TR-80055-U) Avail: NTIS HC A02/MF A01

The effect on approach performance of visual scene information, in combination with basic display information, is discussed for the manual approach and landing task. Good, poor, and night visibility conditions are considered, combined with basic head-up display configurations representing a variety of visual cues (runway contours, etc). A pre-experimental model analysis was performed in terms of an optimal control model. The resulting aircraft approach performance predictions were compared with the results of a moving base simulator program. The results illustrate that the model provides a meaningful description of the visual (scene) perception process involved in the complex (multivariable, time varying) manual approach task with a useful predictive capability. The theoretical framework is shown to allow a straight forward investigation of the complex interaction of a variety of task variables. Author (ESA)

EXPERIMENTAL AND ANALYTICAL STUDIES OF ADVANCED AIR CUSHION LANDING SYSTEMS Final Report
E. G. S. Lee, A. B. Boghani, K. M. Captein, H. J. Rutishauser, H. L. Farley, R. B. Fish, and R. L. Jeffcoat Washington NASA Nov. 1981 188 p refs
(Contract NAS1-15051)
(NASA-CR-3476) Avail: NTIS HC A09/MF A01 CSCL 01C

Several concepts are developed for air cushion landing systems (ACLS) which have the potential for improving performance characteristics (roll stiffness, heave damping, and trunk flutter), and reducing fabrication cost and complexity. After an initial screening, the following five concepts were evaluated in detail: damped trunk, filled trunk, compartmented trunk, segmented trunk, and roll feedback control. The evaluation was based on tests performed on scale models. An ACLS dynamic simulation developed earlier is updated so that it can be used to predict the performance of full-scale ACLS incorporating these refinements. The simulation was validated through scale-model tests. A full-scale ACLS based on the segmented trunk concept was fabricated and installed on the NASA ACLS test vehicle, where it is used to support advanced system development. A geometrically-scaled model (one third full scale) of the NASA test vehicle was fabricated and tested. This model, evaluated by means of a series of static and dynamic tests, is used to investigate scaling relationships between reduced and full-scale models. The analytical model developed earlier is applied to simulate both the one third scale and the full scale response. S.L.

The design and fabrication of a programmable feasibility model of an electronic master monitor and advisory display system for helicoptrs is described. Functional requirements and system interfaces for signal analysis were determined for the helicopters studied. Human factors studies developed formats for reducing crew workloads and maximizing crew performance. Methods of data transfer from sensors to the monitor system were analyzed and appropriate interfaces and data transmission media were recommended. The programmable feasibility model is discussed. A VAPOUR CYCLE CABIN COOLING SYSTEM FOR THE SEA KING MK.50 HELICOPTER

Brian Rebbechi Feb. 1980 59 p refs
(AD-A105211; ARL/MECH-ENG-155; AR-001-793) Avail: NTIS HC A04/MF A01 CSCL 13/1

An experimental determination has been made of the design requirements for a cabin cooling system in the Sea King Mk. 50 helicopter. The purpose of this system is to bring the cabin environment in the helicopter to an acceptable level for effective crew performance. Cooling was provided by an experimental vapour cycle cooling system. Results of the trials have been used to formulate a heat transfer model of the cabin to enable prediction of required cooling capacity for extreme climatic conditions. A comparison, based on the trials results, is made between the performance attainable by a vapour cycle cooling system, and an air cycle system using the available engine bleed. Author (GRA)

EFFECTS OF AERODYNAMIC COUPLING ON THE DYNAMICS OF ROLL AIRCRAFT

Gottfried Sachs and Werner Fohrer Jan. 1981 48 p refs In GERMAN; ENGLISH summary
Avail: NTIS HC A03/MF A01

The effects of coupling of longitudinal and lateral aerodynamic characteristics on the dynamics of aircraft roll were studied, using simplified relations and complete six-degree of freedom calculations. The aerodynamic coupling is caused by unsymmetric flow conditions resulting from sideslipping, where rolling moments due to angle of attack and pitching moments due to angle of sideslip, are of particular significance for the problem. It is shown that the attainable rate of roll is significantly influenced and that marked effects on stability are possible. Furthermore, it is shown that aerodynamic coupling can cause autorotation, i.e., a rolling motion without aileron forcing moments. Author (ESA)

ADVANTAGES AND LIMITATIONS OF VARIOUS MATERIALS USED IN THE CONSTRUCTION OF MODULES [ATOUT ET LIMITES D'EMPLOIS DES DIVERS MATERIAUX UTILISES DANS LA CONSTRUCTION DES CELLULES]

G. Hilaire 30 Jul. 1981 39 p In FRENCH Presented 9th Colloq. Aciers et Alliages Speciaux dans les Ind. Aerospatiales, Le Bourget, France, 11 Jun. 1981
(SNIAS-812-551-103; C-42796) Avail: NTIS HC A03/MF A01

Steels, light alloys, titanium alloys, and composites are compared for economy, mechanical characteristics, energy content, fatigue effects and toughness. The use of these materials in civil and military aircraft, helicopters, and engines is surveyed. Increasing use of composites is forecast for the next decade, with a corresponding drop in the use of light alloys. Steels and titanium alloys should not be affected. Author (ESA)

EFFECT OF A PART SPAN VARIABLE INLET GUIDE VANE ON TF34 FAN PERFORMANCE Final Report

Jose Alvarez and Paul W. Schneider Sep. 1981 133 p refs
(Contract NAS3-21624)
(NASA-CR-165458; R81AEG030) Avail: NTIS HC A07/MF A01 CSCL 21E

Experimental aerodynamic and performance data were obtained from a TF34 engine. Part span variable inlet guide vanes mounted in front of the fan on the TF34 engine were tested to demonstrate the feasibility of modulating air flow and thrust for vertical takeoff aircraft systems. The fan was mapped to stall for a range of speeds and variable inlet guide were settings. Modulated fan tip performance and unmodulated hub performance were evaluated with a without an extended fan bypass splitter. The effect of a crosswind distortion screen on performance was also evaluated. R.J.F.

VIBRATION TEST PROCEDURES FOR ACCESSORY ANGLE DRIVE GEARBOXES ON ATAR 09C ENGINES

P. D. McFadden and D. H. Edwards Mar. 1981 57 p refs
(AD-A105269; ARL/MECH-ENG-TM-408; AR-002-264) Avail: NTIS HC A04/MF A01 CSCL 21/5

The Accessory Angle Drive gearbox powers the fuel and hydraulic pumps on the Atar engine in the Mirage aircraft. To insure against in-flight failure, each gearbox is vibration tested under load after overhaul by the local contractor. A new vibration testing technique, offering greatly improved accuracy and reliability, has been developed. The technique uses a real-time, fast-fourier spectrum analyzer, with direct digital read-out in engineering units, and a tracking adapter with built-in antialiasing filter. This report defines correct procedures for the connection and operation of the instruments, and the interpretation of the results. Author (GRA)

THE USE OF METAL FINISHING IN AIRCRAFT FUEL SYSTEMS

S. L. Forgham and H. L. Tulloch 1981 28 p refs
Avail: NTIS HC A03/MF A01

Topics discussed are; (1) corrosion resistant finishes; (2) finishes to aid manufacture; (3) repair and overhaul; and (4) bearing finishes. In the case of (1) hydrogen embrittlement is identified as a major problem and processes generating hydrogen at the surface should be closely controlled. Results on drawing size of cadmium plating of rotor blades are presented. Various techniques of electrodepositing are compared. Pump rig tests on fuels containing chlorides, showing the effect on torque of additives after a 5 hr run and an additional 16 hr standing, are reported. Author (ESA)

HC A15/MF A01

A three dimensional method of characteristics is developed for the calculation of the supersonic flow in the inlet region and the blade-to-blade channels of blade cascades and high transonic axial flow compressors with subsonic or supersonic axial velocity. The numerical scheme is accurate, and required computer times are short. Results of calculations on several linear or annular cascades and rotating blade rows are presented and compared with test results. Author (ESA)

RELIABILITY ANALYSIS OF THE F-8 DIGITAL FLY-BY-WIRE SYSTEM

L. D. Brock and H. A. Goodman Oct. 1981 152 p refs

(Contract NAS4-2571)

(NASA-CR-163110; R-1324) Avail: NTIS HC A08/MF A01 CSCL 01C

The F-8 Digital Fly-by-Wire (DFBW) flight test program intended to provide the technology for advanced control systems, giving aircraft enhanced performance and operational capability is addressed. A detailed analysis of the experimental system was performed to estimated the probabilities of two significant safety critical events: (1) loss of primary flight control function, causing reversion to the analog bypass system; and (2) loss of the aircraft due to failure of the electronic flight control system. The analysis covers appraisal of risks due to random equipment failure, generic faults in esign of the system or its software, and induced failure due to external events. A unique diagrammatic technique was developed which details the combinatorial reliability equations for the entire system, promotes understanding of system failure characteristics, and identifies the most likely failure modes. The technique provides a systematic method of applying basic probability equations and is augmented by a computer program written in a modular fashion that duplicates the structure of these equations. COMPUTATIONAL METHODS OF ROBUST CONTROLLER DESIGN FOR AERODYNAMIC FLUTTER SUPPRESSION Final Report, 14 Nov. 1980 - 15 Nov. 1981

Leonard R. Anderson 15 Nov. 1981 86 p refs Presented at the 3rd Intern. Conf. on Math., Calif., 29-31 Jul. 1981 Submitted for publication

(Grant NAG1-80)

(NASA-CR-164983; VPI-Aero-125) Avail: NTIS HC A05/MF A01 CSCL 01C

The development of Riccati iteration, a tool for the design and analysis of linear control systems is examined. First, Riccati iteration is applied to the problem of pole placement and order reduction in two-time scale control systems. Order reduction, yielding a good approximation to the original system, is demonstrated using a 16th order linear model of a turbofan engine. Next, a numerical method for solving the Riccati equation is presented and demonstrated for a set of eighth order random examples. A literature review of robust controller design methods follows which includes a number of methods for reducing the trajectory and performance index sensitivity in linear regulators. Lastly, robust controller design for large parameter variations is discussed. R.J.F.

SIMULATOR CERTIFICATION METHODS AND THE VERTICAL MOTION SIMULATOR Final Report

Thomas W. Showalter 23 Sep. 1981 67 p refs

(Contract NAS2-9741)

(NASA-CR-166252) Avail: NTIS HC A04/MF A01 CSCL 14B

The vertical motion simulator (VMS) is designed to simulate a variety of experimental helicopter and STOL/VTOL aircraft as well as other kinds of aircraft with special pitch and Z axis characteristics. The VMS includes a large motion base with extensive vertical and lateral travel capabilities, a computer generated image visual system, and a high speed CDC 7600 computer system, which performs aero model calculations. Guidelines on how to measure and evaluate VMS performance were developed. A survey of simulation users was conducted to ascertain they evaluated and certified simulators for use. The results are presented. S.L.

CONSTRUCTION AND PERFORMANCE OF NAL TWO-DIMENSIONAL TRANSONIC WIND TUNNEL

1980 104 p refs In JAPANESE; ENGLISH summary

(NAL-TR-647; ISSN-0389-4010) Avail: NTIS HC A06/MF A01

The construction and the results of initial calibration are described. This tunnel was built to meet the requirements of high Reynolds number testing of wing sections at transonic regime. It is a blowdown tunnel with a test section of 0.3m x 1.0m. The required capability of this wind tunnel is for Mach numbers ranging from 0.2 to 1.2 and for a Reynolds number up to 40 million at Mach number 0.8 with sufficient running time. An outline of the design objectives is given. The completed facilities, i.e., the wind tunnel, the instrumentation and operation system, the silencer and auxiliary equipment of the air compressor and the air reservoir, are described in detail. The performance of the tunnel when it is empty is described, and the results of a few experiments with an airfoil model of the NACA 64A410 are presented. High Reynolds number testing can be achieved in this wind tunnel without any trouble. S.W.

A LOOK INSIDE THE LANGLEY 16-FOOT TRANSONIC TUNNEL: USER'S GUIDE

Kathryn H. Peddrew, comp. Aug. 1981 197 p refs

(NASA-TM-83186) Avail: NTIS HC A09/MF A01 CSCL 14B

The 16-foot transonic tunnel is a single-return atmospheric wind tunnel having a slotted test section. The primary emphasis for research in this facility is the integration of the propulsion system into advanced aircraft concepts. The large test section size, 15.5 fest in diameter lends itself to conducting research in this area, where large models are required in order to provide adequate definition of the model geometry associated with the integration of the propulsion system. The nominal test Mach number range for this facility varies from 0.20 to 1.3. Topics covered include (1) facility description; (2) model installation equipment for aerodynamics; (3) model support system for propulsion simulation testing; (4) propulsion simulation systems; (5) calibrating propulsion simulation systems; (6) instrumentation; (7) data acquisition; (8) model design criteria; and (9) wind tunnel test planning. EFFECT OF FIGHTER ATTACK SPECTRUM ON COMPOSITE FATIGUE LIFE Final Report, Sep. 1978 - Oct. 1980

R. Badaliance and H. D. Dill Mar. 1981 126 p refs

(Contract F33615-78-C-3218; AF Proj. 2401)
(AD-A105034; AFWAL-TR-81-3001) Avail: NTIS HC A07/MF A01 CSCL 11/4

The objective was to evaluate the effect of fighter wing load spectrum variations on the life behavior of composite structures. Six types of spectra were generated: (a) clipping to 90% test limit stress, (b) addition of stress overloads, (c) addition of low loads, (d) truncation to 70% test limit stress, (e) clipping of tension loads, (f) increased severity and number of air-to-air loads. A single hole compression test specimen was designed to simulate fatigue critical areas of fighter wing skins. GRA

FIRE EXTINGUISHANT MATERIALS Patent Application
Robert L. Altman, Ludwig A. Mayer (San Jose State Univ.), and Alan C. Ling, inventors (to NASA) (San Jose State Univ.) Filed 3 Nov. 1981 11 p
(NASA-Case-ARC-11252-1; US-Patent-Appl-SN-317977) Avail: NTIS HC A02/MF A01 CSCL 21B

Fire extinguishant materials were developed for extinguishing fires on hot metal surfaces caused by liquid fuels such as jet engine fuels. The composition of the materials is a mixture of a finely divided aluminum compound and alkali metal, stannous or plumbous halide. The aluminum compound may be aluminum hydroxide, alumina or boehmite, but preferably it is an alkali metal dawsonite. The metal halide may be an alkali metal, e.g. potassium iodide, bromide, or chloride, or stannous or plumbous iodide, bormide, or chloride. Potassium iodide is preferred. The presence of the halide improves the performance of the aluminum compound in extinguishing fires on hot metal surfaces. NASA

CHEMISTRY OF COMBUSTION OF FUEL-WATER MIXTURES Final Technical Report, 1 Jun. 1980 - 31 May 1981
Edward G. Skolnik, Edward T. McHale, and Harley L. Heaton Sep. 1981 51 p refs
(Contract N00014-80-C-0534)
(AD-A105401) Avail: NTIS HC A04/MF A01 CSCL 21/2

The continuation of an experimental flame study concerning the nonphysical processes that lead to soot suppression when water is added to fuel, begun in a previous program is reported. The study included a mapping of temperature, chemical species and soot profiles of laminar diffusion flames with and without water added. Fuels studied included ethylene and a benzene/hydrogen mixture. Flames with nonreactive gases added (argon, nitrogen), were also studied for comparison purposes. The study concludes that the reduction of soot by water in an ethylene diffusion flame can be completely explained by thermal effects. The results are not as definitive for benzene. The addition of water causes a greater reduction in soot than does a thermally equivalent addition of argon, but no noticeable differences in chemical species profiles are observed. There is evidence, however, that water addition causes an increase in concentration of an oxygen-containing tarry substance present in the flame prior to soot formation. During the course of the study it was also possible to estimate both soot particle diameters (1-2 x .000001 cm at the beginning of the oxidation zone) and an activation energy for soot oxidation by the OH radical (7-8 kcal/mole). In addition, it was possible to confirm the presence of and quantify the oxygen concentration in the center of diffusion flames, first reported under the previous program. Author (GRA)

PROGRESS IN PROTECTIVE COATINGS FOR AIRCRAFT GAS TURBINES: A REVIEW OF NASA SPONSORED RESEARCH
John P. Merutka 1981 29 p refs Presented at the 5th Ann. Conf. on Composite and Adv. Mater., Merritt Island, Fla., 19-22 Jan. 1981; sponsored by the Am. Ceramic Soc., Inc.
(NASA-TM-82740; E-711) Avail: NTIS HC A03/MF A01 CSCL 11F

Problems associated with protective coatings for advanced aircraft gas turbines are reviewed. Metallic coatings for preventing titanium fires in compressors are identified. Coatings for turbine section are also considered. Ductile aluminide coatings for protecting internal turbine-blade cooling passage surface are also identified. Composite modified external overlay MCrAlY coatings deposited by low-pressure plasma spraying are found to be better in surface protection capability than vapor deposited MCrAlY coatings. Thermal barrier coating (TBC), studies are presented. The design of a turbine airfoil is integrated with a TBC, and computer-aided manufacturing technology is applied. S.L.

DEVELOPMENT OF CATALYTIC SYSTEMS FOR THE CONVERSION OF SYNGAS TO JET FUEL AND DIESEL FUEL AND HIGHER ALCOHOLS Annual Report
William A. Slegeir Oct. 1980 18 p
(Contract DE-AC02-76CH-00016)
(DE82-000067; BNL-51423) Avail: NTIS HC A02/MF A01

A highly active series of Fischer-Tropsch catalysts are developed on the basis of insights provided by the oxide theory. The method of catalyst formulation is unique in Fischer-Tropsch chemistry, yet is simple and reproducible. These catalysts are superior to ordinary catalysts for hydrocarbon synthesis with regard to rate, operating conditions, and, product selectivity and longevity. The products of these catalysts are ideally suited for use as diesel and jet fuels. Once formed, the catalysts display remarkable stability toward air. Oxide interactions, the role of promoters, and the synergistic behavior of bimetallic catalysts systems are studied. Bimetallic systems for hydrocarbon and alcohol synthesis are discussed. DOE

MOVING TARGET DETECTOR/AIRPORT SURVEILLANCE RADAR (ASR-7) FIELD EVALUATION Final Report, Feb. 1979 - Jan. 1980
W. Goodchild Aug. 1981 52 p refs
(AD-A105196; FAA-CT-81-31; FAA-RD-81-57) Avail: NTIS HC A04/MF A01 CSCL 17/7

The Moving Target Detector (MTD) II, a sophisticated radar processor, was evaluated to determine its capability to provide improved radar detection in an air traffic control (ATC) environment. The MTD II was installed on one channel of an airport surveillance radar (ASR-7) at Burlington, Vermont. The major objective of testing was to compare the performance of the MTD II with that of the ASR-7 Moving Target Indicator (MTI). This report concentrates on the comparative probability of detection, false alarm rate, MTI improvement factor, subclutter visibility, dynamic range, velocity response, and the simultaneous flight test results of the two systems. Comparison of the MTD II to the MTD I system is made when necessary to show major improvements or deficiencies in the MTD II design. The results of the tests have shown that the MTD II provides surveillance capabilities superior to those of the ASR-7/MTI. Author (GRA)

COLUMBUS, OHIO, VOICE RESPONSE SYSTEM DEMONSTRATION AND EVALUATION Final Report, Dec. 1979 - Apr. 1980
John C. Henline Jun. 1981 54 p
(FAA Proj. 131-402-854)
(AD-A104750; FAA-CT-80-50; FAA-RD-81-20) Avail: NTIS HC A04/MF A01 CSCL 17/2

The Voice Response System (VRS) was subjected to a 4-month demonstration in the Columbus, Ohio, Flight Service Station (FSS) preflight area. The purpose of the experiment was to test and evaluate the VRS system, user acceptance, and the effects on the specialists/facility workload, and to determine the general impact of VRS on the Columbus (CMH) FSS preflight area. In addition, the test permitted collection of technical performance data which could serve as the framework for an integrated national system for the mass dissemination of weather information. It is concluded that the VRS caused a shift in user demand/preference, reduced FSS briefer workload, reduced demand for basic pilots automatic telephone weather answering service (PATWAS), and was determined to be acceptable to the general aviation user. AN INVESTIGATION OF F-16 NOZZLE-AFTERBODY FORCES AT TRANSONIC MACH NUMBERS WITH EMPHASIS ON MODEL SCALE EFFECTS Final Report, Oct. 1979 - Sep. 1980
Earl A. Price, Jr. Sep. 1981 149 p refs
(AD-A104905; AEDC-TR-80-57; AFWAL-TR-81-2110) Avail: NTIS HC A07/MF A01 CSCL 20/4

An experimental program was conducted to provide nozzle-afterbody data with a minimum interference support system on a 0.25-scale F-16 model and to determine the interference induced on then nozzle-afterbody region by sting and strut model support systems. Data obtained on the 0.25-scale model are compared with data from a 0.11-scale model for evaluation of model scale effects. The investigation was conducted over the Mach number range from 0.6 to 1.5. Data are presented in terms of coefficients and increments in coefficients of nozzle-afterbody axial and normal forces obtained from integrating pressure data. High-pressure air at ambient temperature was utilized for exhaust plume simulation. The results indicate close agreement in axial-force coefficient between configurations having full and annular nozzles at design pressure ratio. Very little effect of Reynolds number was found on the nozzle-afterbody axial force. Wave interference adversely affected axial-force data from the 0.25-scale model at Mach numbers between 1.0 and 1.1, producing lower axial force on the model afterbody. Large differences were determined in both the magnitude and the sign of strut interference from the two model installations. Author (GRA)

GERMAN-ARGENTINE EXPERIMENT: VERTICAL-ROTOR WIND ENGINE
Peter Raabe *In its* W. Europe Rept.: Sci. and Technol., No. 72 (JPRS-78876) 1 Sep. 1981 p 18-19 Transl. into ENGLISH from Tagesspiegel (Berlin), 4 Jul. 1981 p 12

Avail: NTIS HC A03/MF A01

Designed by aerodynamists, a wind motor built in Patagonia, is independent of the direction of the wind due to its vertical rotating axis. The narrow rotor blades have optimum aerodynamic efficiency. Drum-like wind collectors at the top and bottom of the rotating axis serve as starters. The plant incorporates simple instead of sophisticated mechanical parts, and its maintenance requirements are extremely low. Only the two rotating bearings located at the top and bottom of the axis require lubrication, with the oil being changed only twice a year. A.R.H.

ANALYSIS OF INTEGRATED FUEL-EFFICIENT, LOW-NOISE PROCEDURES IN TERMINAL-AREA OPERATIONS
J. B. McKinley Jan. 1981 125 p refs
(Contract DE-AC01-80CS-50141)
(DE81-029833; DOE/CS-50141/T1) Avail: NTIS HC A06/MF A01

The specific aviation energy conservation issues, terminal area fuel conservation and airport noise level relationships, are investigated. The potential fuel savings and noise level reduction in the Los Angeles International (LAX) terminal area between 1980 and 1990 attributable to compliance with the noise requirements of FAR Part 36 were quantified. These savings are due to the retiring, retrofiting and re-engining of older narrow-body aircraft (DC-8, B707, etc.) and the growth of wide body aircraft operations (DC-10, B747, B767, etc.). Current noise abatement procedures that could be relaxed without adversely impacting current (1980) noise levels, and at the same time conserving additional fuel. Two FAA computer models were used. The Integrated Noise Model (INM) Version 2.7, was used for noise analysis, and INKMOD, a preliminary fuel burn model, for the fuel analysis. The results of this detailed analysis revealed that due to the changing aircraft mix at LAX to include more wide body aircraft and fewer narrow body aircraft operations, airport noise level will decrease by 8.5 and 9.2 square miles on the 75 Ldn contour for 1985 and 1990, respectively, from the 1980 baseline. THE IMPACT OF NEW GUIDANCE AND CONTROL SYSTEMS ON MILITARY AIRCRAFT COCKPIT DESIGN
Aug. 1981 217 p refs In ENGLISH; partly in FRENCH Symp. held in Bad-Cannstatt, West Germany, 5-8 May 1981
(AGARD-CP-312; ISBN-92-835-0297-3) HC A10/MF A01

The requirements and technologies involved in control systems were reviewed. Topics incude: displays; controls/displays system integration; automated systems/man interface; and cockpit systems evaluation. Emphasis is placed on the design of a cockpit layout with controls and displays that maximize the overall aircraft capability while keeping the pilot's workload within bounds by the use of more automation of system management. For individual titles, see N82-13049 through N82-13064.

HOW THE HELICOPTER COCKPIT DESIGNER USES DIGITAL AVIONICS
John H. Emery *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 13 p ref
Avail: NTIS HC A10/MF A01

An overview of the approaches to helicopter cockpit design made possible through the application of advanced multiplex technology to cockpit displays and controls is presented. This technology enables the pilot to have more information available while, at the same time, reducing his workload, and provides for substantially improved cockpit management. One of the major research programs through which this technology was tailored for military helicopters is ADAS (Army Digital Avionics System). This program is discussed, along with Bell helicopter cockpit designs. T.M.

ELECTRONIC FLIGHT DECK DISPLAYS FOR MILITARY TRANSPORT AIRCRAFT
R. A. Chorley *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 12 p refs
Avail: NTIS HC A10/MF A01

These display systems offer operational and economic advantages which can be realized in military as well as in civil aircraft. In particular, the flexibility of the display formats which can be provided, and the ease with which the information content can be changed, enable all the information required for the control of a transport aircraft to be displayed on the main panel, and go a long way towards making operation by a two-man crew possible. In addition, the flexibility of an electronic display system makes it feasible to minimize the effect of failures witin the display system to an extent which is impossible in the case of conventional instruments. Full realization of this capability, which calls for careful selection of the system architecture to be employed, may lead to a significant in mission success. A discussion of CRT displays is presented. T.M.

COLOR CRT DISPLAYS FOR THE COCKPIT
Harry L. Waruszewski *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 22 p refs
Avail: NTIS HC A10/MF A01

Color displays are currently being proposed for installation or are being installed in civilian and military aircraft cockpits. The complexity of designing a good color display is much greater than that of a monochromatic display. The human factors data and cockpit requirements needed to develop color cockpit displays so that requirements for a usable display can be generated are discussed. The color display technology was evaluated with respect to satisfying the established human factors requirements. Test methodologies need to be developed to determine compliance of the color displays to the specification requirement. Finally, the need for displays to be integrated into the cockpit using total cockpit human factors criteria to maximize the possible workload reduction and safety of the aircraft is discussed. T.M.

N82-13052# Thomson-CSF, Paris (France).
HEAD UP DISPLAYS
Claude Maureau *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 7 p
Avail: NTIS HC A10/MF A01

The displays present information to pilots without depriving them of a simultaneous external view. This implies that head-up dispdisplays are collimated displays. The problems involved with collimation are discussed and the possibility of head-up providing pilots with directional information is considered. T.M.

N82-13053# Army Avionics Research and Development Activity, Fort Monmouth, N. J.
INTEGRATION OF CONTROLS AND DISPLAYS IN US ARMY HELICOPTER COCKPITS
J. A. Dasaro and C. T. Elliott *In* AGARD The Impacts of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 19 p refs
Avail: NTIS HC A10/MF A01

Expanded missions such as anti-armor, night surveillance, and air-to-air, coupled with the survivability requirement of nap-of-the-Earth flight, dictate the approach to cockpit design. This approach must apply the latest technological innovations in the areas of controls, displays multiplexing, and microprocessors to unburden the pilot. Space, weight, and cost constraints placed on the cockpit system designers must also be satisfied. The U.S. Army completed a full scale engineering development program in the area of cockpit integration, and is currently involved in a more ambitious exploratory development effort. An overview of these efforts to integrate the helicopter cockpit, including results of similation experiments and operational flight tests, is presented. T.M.

A STANDARD CONTROL DISPLAY UNIT FOR MULTI-AIRCRAFT APPLICATION
Ronald L. Swanson and Craig R. Scougton *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 10 p
Avail: NTIS HC A10/MF A01

The need for standardization of military hardware is well documented both within the US DOD and NATO. Standardization issues revolve mainly around interoperability, logistics, and life-cycle cost advantages. The issue of standardization and its suitability in the design of aircraft control/display units (CDU) is addressed. Potential benefits, requirements, and remaining problems associated with standardization of avionics control displays are discussed. Included is a discussion of a CDU that is currently being produced which has many of the features considered essential to the ultimate standard CDU. T.M.

USING VOICE CONTROL ONBOARD COMBAT AIRCRAFT [UTILISATION DE LA COMMANDE VOCALE A BORD DES AERONEFS DE COMBAT]
J. R. Coster and J. M. Melocco *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpits Design Aug. 1981 5 p In FRENCH
Avail: NTIS HC A10/MF A01

The use of the voice would be a valuable tool in resolving problems associated with pilot workload, in reducing the surface of the flight instrument system and the complexity of the man machine interface in high performance combat aircraft. A program established at the Laboratory of information for Mechanics and Engineering Sciences validates in aircraft environments the methods of speech recognition and synthesis developed in research laboratories. It is merely a matter of the universal recognition, at the acoustic level of isolated words pronounced by a single speaker. The techniques used are described. These include laboratory experiments involving an aeronautical dialog in a noisy environment and experimentation with a simulator of a vocal dialog applied to an aircraft with modern weapons and to the study of human factors. Experimentation also takes place in a flight simulator. Transl. by A.R.H.

EXPERIMENTAL INVESTIGATION OF A HELMET MOUNTED SIGHT/DISPLAY FOR HELICOPTER
R. Beyer, E. Danneberg, E. Kohnen, and H. Stein *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 11 p
Avail: NTIS HC A10/MF A01

A helmet mounted sight/display (HMS/D) combined with an infrared camera and electronic instrument displays was investigated as a guidance aid for the low level flight of helicopters at night. The static and dynamic accuracy of the tracking mechanism which aligns the lines of sight of both the pilot and the camera was determined by means of a target and motion simulator. System performance was checked with a Bo 105 helicopter in low level flight at night. From the results obtained the importance of the HMS/D as an guidance aid becomes evident relative to other night vision/display systems. Author

USE OF A HELMET-MOUNTED MATRIX DISPLAY FOR PRESENTING ENERGY-MANEUVERABILITY INFORMATION DURING SIMULATED CLOSE COMBAT
D. N. Jarrett *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 10 p refs
Avail: NTIS HC A10/MF A01

Since continuous visual contact display (HMMD) with the enemy is essential in close combat the provision of this information on a helmet-mounted diplay (HMMD) may be particularly useful. However, the (in) visibility of the image against a bright sky background, the increased helmet weight and other inconveniencing counter effects when coupled with the high attentional and physical demands of combat, may obviate any advantages of controlling the aircraft using the extra information. A series of exercises was set up to assess the HMMD in this application. The device was the subject of a flight trial in a light jet aircraft, and two studies were completed in the newly-commissioned RAE air combat simulator. These studios enabled pilots to become familiar with the device and the unusual display format, in order to assess their combined usefulness in a combat context. A.R.H.

TANKER AVIONICS AND AIRCREW COMPLEMENT EVALUATION

Richard W. Moss and Gregory J. Barbato (Bunker-Ramo Corp., Dayton, Ohio) *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 18 p refs

Avail: NTIS HC A10/MF A01

A four phase effort addressing the control and display design issues associated with operating the SAC'S KC-135 tanker without the navigator crew position is discussed. Topics covered include the mission analysis phase during which the tanker's operational responsibilities were defined and documented; the design phase durng which alternative crew station design concepts were developed; the mockup evaluation phase which accomplished initial SAC crewmember assessment of cockpit designs; and the simulation phase which validated the usability of the crew system redesign. A recommended crew station configuration is examined and some of the philosophy underlying the selection of cockpit hardware and systems is discussed. A.R.H.

F/A 18 HORNET CREW STATION

Eugene C. Adam *In* AGARD The Impact of New Guidance and Control Systems on Mil. Aircraft Cockpit Design Aug. 1981 6 p

Avail: NTIS HC A10/MF A01

The Hornet crew station design requirement was to essentially provide the capability contained in both the F-4 and A-7 weapon systems so as to perform both the fighter attack roles, make it operable by one pilot, and increase mission reliability by a combination of improved hardware reliability and functional redundancy. To put this requirement in perspective, the F/A-18 cockpit has 40% less usable area than any of its contemporaries. This area constraint necessitated extensive integration of the weapon system controls and displays. The resultant crew station features four miltipurpose cathoderay displays driven by two mission computers, an integrated upfront control panel, and numerous automatic functions on the stick and throttle. The rationale leading up to the configuration is described and a few examples of the one-man-operability features of the Hornet and how they would used by the pilot are presented. A.R.H.

PERFORMANCE OF HIGHLY INTEGRATED INLETS FOR SUPERSONIC AIRCRAFT

Lewis Surber, Jan Syberg, and Joseph Koncsek *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 12 p refs Prepared in cooperation with Boeing Military Airplane Co., Seattle

Avail: NTIS HC A22/MF A01

Performance data obtained on several subsonic diffusers applicable to advanced supersonic tactical aircraft configurations were used to select a forebody-inlet model for proof-of-concept wind tunnel performance evaluation. Three of the diffusers were designed for high aspect ratio inlets having throat aspect ratios greater than seven. A fourth design incorporated a low aspect ratio inlet. Two of the high aspect ratio diffusers and the low aspect ratio diffuser incorporated duct bends typical of inlets substantially offset from the engine centerline. Preliminary tests of the high aspect of ratio diffuser produced high total pressure recovery coupled with relatively low flow distortion. Furthermore, the use of longitudinal vanes in one high aspect ratio diffuser provided reductions in engine face flow distortion with very little performance degradation. Proof-of-concept tests further investigated the performance of a high aspect ratio, side-mounted external compression supersonic inlet. Tests were performed in a 16-foot supersonic propulsion wind tunnel at Mach numbers of 1.6 to 2.2 over a -5 to 12 deg angle of attack range and sideslip angles from -8 to +8 deg. The results of these tests support the use of high aspect ratio inlets with sharp duct bends as a viable design option in future supersonic aircraft designs. M.G.

SOME RAE RESEARCH ON SHIELDED AND UNSHIELDED FUSELAGE MOUNTED AIR INTAKES AT SUBSONIC AND SUPERSONIC SPEEDS

J. A. Ross, I. McGregor, and A. J. Priest *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 16 p refs

Avail: NTIS HC A22/MF A01

The incidence performance of fuselage-mounted intakes at subsonic and supersonic speeds is examined. The effects of simple changes in intake geometry, such as increasing contraction ratio and altering lower lip shape, are first considered; it is shown that such modifications can be beneficial at subsonic speeds, but drag penalties tend to limit their use at higher Mach numbers. Two intake locations that potentially offer a good degree of incidence shielding - underfuselage and understrake - are then examined. It is concluded that satisfactory performance can be obtained with an understrake installation, but a detailed study of strake shape, slots, splitter plates and boundary layer diverters must be made if the combinaion is to be successful over the whole of the intended flight envelope. However, for the configurations tested, the underfuselage location offers generally better intake performance lower technical risk. Finally, some results for a side-mounted staggered lip intake are presented, together with some two dimensional calculations of the mutual interference effects that occur between the upper and lower lips. It is suggested that an intake of this type can be competitive with an underfuselage installation. M.G.

PREDICTION AND MEASUREMENT OF TIME-VARIANT, THREE-DIMENSIONAL FLOWS IN MILITARY AIRCRAFT INTAKES

D. E. Colbourne and J. E. Flitcroft *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 18 p refs

Avail: NTIS HC A22/MF A01

The development of a computational method suitable for predicting the three dimensional flows within the diffuser sections of aircraft intakes is described. A fast method for automatic grid generation, application to ducts of any smoothly varying cross-sectional shape, is discussed. The development of a finite-volume, time-marching method for solving the flow equations is also described. The validity of the chosen techniques is discussed in the light of comparisons with analytical and empirical results. Empirical techniques were developed to examine flows in which viscous or time variant effects are dominant. A rotating yaw meter rake was developed to undertake detailed flow surveys at the exit of model diffusers, and results may be obtained from tests both in isolation and in the presence of a compressor. The development of instrumentation and data processing facilities for measuring instantaneous engine face total pressure distortion in small scale models is also described, together with the validation of this technique by comparison with results from a full-size replica of the intake tested under free-jet conditions. M.G.

N82-13070# British Aerospace Aircraft Group, Bristol (England).

EFFECTS OF INTAKE GEOMETRY ON CIRCULAR PITOT

INTAKE PERFORMANCE AT ZERO AND LOW FORWARD SPEEDS

A. C. Willmer, T. W. Brown, and E. L. Goldsmith (RAE, Bedford, England) *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 16 p refs Sponsored in part by Ministry of Defence
Avail: NTIS HC A22/MF A01

A series of experiments on circular cross-section pitot intakes at Mach numbers from 0 to 0.21 and angles of incidence and sideslip from 0 to 40 deg are presented. Measurements were made at the engine face of 72 pitot pressures, 4 unsteady pitot pressures, swirl angle at six positions, and boundary layer profiles at four positions. Static pressure distribution around the cowl lips and along the diffusers were also measured. Five cowl lips covering a range of contraction ratios and lip shapes were tested with both a straight and an S bend diffuser. The effect of inserting parallel section spacers between the cowl lip and the front of the subsonic diffuser and between the end of the subsonic diffuser and the engine face instrumentation and the effect of a thin lip slot upstream of the intake throat were evaluated. Results indicate that, lip losses may be decreased by increasing contraction ratio, fitting a lip slot or a forward spacer. Steady state flow distortion at the engine face is decreased by increasing lip contraction ratio or by fitting an aft extension. For the S duct tested, distortion levels are set by the diffuser as much as by incidence. Sideslip, however, lessens the distortions. M.G.

TRANSONIC FLOWS IN AN AIR INLET WITH LARGE INCIDENCE AND THE EFFECT OF A BLOWING TRAP [ECOULEMENTS TRANSSONIQUES DANS UNE PRISE D'AIR EN GRANDE INCIDENCE AT EFFET DE TRAPPE DE SOUFFLAGE]

A. Dyment, P. Gryson, and J. P. Flodrops *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 13 p ref In FRENCH

Avail: NTIS HC A22/MF A01

Flow in a bidimensional air intake with large incidence was studied under conditions in which the upstream flow was subsonic and the internal flow could be regulated. The phenomena following flow separation were examined, especially the homogenization of the internal flow. A device for improving mogenization which involves a natural deflection accomplished by a scoop designed to guide the captivated air was tested. The universal aspect of internal flow was studied using probes in different sections. The unsteady phenomena were analyzed from ultra high speed visualizations and the mean flow was characterized from classic visualization. The insertion of the deflector appreciably improved the performance of the air intake. The coefficient of output (sigma) and the total mean pressure (P sub tm) were considerably improved at the level of the compressor. While the use of the scoop to guide the air towards the slot had only a weak influence on sigma and P sub tm at the compressor level, it brought an appreciable gain in the speed of homogenization of the internal flow. Transl. by A.R.H.

SUBSONIC MILITARY AIRCRAFT ENGINE INTAKE: AN INTEGRATED THEORETICAL EXPERIMENT DESIGN

G. Bertolone and L. Fornasier *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 17 p refs

Avail: NTIS HC A22/MF A01

Two numerical codes were developed for the simulation of the engine intake-induced flow field in two dimensional transonic and three dimensional subsonic cases. Both codes were obtained by modification of existing codes suitable for the computation of the exterior flow past airfoils (by a finite element method) and about three dimensional arbitrary configurations (by a panel method). Computed results and comparison with experimental data pertinent to the analysis of a single bifurcated intake proved usefulness of the present numerical schemes for engineering applications. Engine face auxiliary doors design and side intakes diverter shape optimization was studied. Following an extensive testing program performed on a static model, the engine face auxiliary doors with annular air admission into the primary long type duct appeared to be a good alternative to the classical solution placed at the main inlet entry. Diverter geometry influence both on aerodynamics, in terms of drag coefficient, and intake performance, in terms of distortion coefficient, was investigated by testing a low speed model. R.J.F.

N82-13074# Messerschmitt-Boelkow-Blohm G.m.b.H., Munich (West Germany). Unternehmensbereich Flugzeuge.

THE DESIGN AND DEVELOPMENT OF THE TORNADO ENGINE AIR INTAKE

C. P. Stocks (British Aerospace, Warton, England) and N. C. Bissinger *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 21 p refs
Avail: NTIS HC A22/MF A01

The design and development of the Tornado aircraft supersonic intake is described. Critical aerodynamic design areas are outlined with special emphasis on compatibility. The intakes were designed to satisfy the conflicting requirements of greater than Mach 2 operation and a very wide incidence operating envelope at subsonic speeds. The problem of design loads is reviewed as well as the theory and operation of the automatic control system. Propulsion system behavior in flight and some examples of intake-airframe interaction are described. R.J.F.

N82-13075# Air Force Wright Aeronautical Labs., Wright-Patterson AFB, Ohio.

INTEGRATION OF ADVANCED EXHAUST NOZZLES

Douglas L. Bowers and James A. Laughrey *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 14 p refs

Avail: NTIS HC A22/MF A01

Attributes of both axisymmetric and nonaxisymmetric advanced nozzles and their incorporation into an aircraft to improve cruise performance, maneuverability and short takeoff and landing operation are discussed. It was concluded that when used as a trimming device, advanced exhaust nozzles with thrust vectoring can provide significant aircraft cruise drag reduction. The aftbody/nozzle installation for advanced airframes and exhaust nozzles must be approached very carefully to demonstrate an installed drag benefit. For maneuver, advanced thrust vectoring exhaust nozzles show advantages at high angle of attack. Improved turn rate and instantaneous maneuver performance can be provided by utilizing these advanced exhaust nozzles in advanced aircraft. For short takeoff and landing aircraft advanced exhaust nozzles with both thrust vectoring and thrust reversing may be necessary. Thrust vectoring up to 60 degrees (or higher) and a propulsive lift control system may be required. R.J.F.

N82-13076# Rolls-Royce Ltd., Bristol (England). Installation Aerodynamics Group.

THE SUBSONIC PERFORMANCE OF PRACTICAL MILITARY VARIABLE AREA CONVERGENT NOZZLES

L. R. Harper IN AGARD Aerodyn. of Power Plant Installation Sep. 1981 11 p refs

Avail: NTIS HC A22/MF A01

Performance considerations involved in the selection of a variable area nozzle for reheated engines for combat aircraft are discussed. The main emphasis is on dry operation at subsonic speeds since drag, weight, leakage and other penalties in this regime can prevent an aircraft attaining its design radius of action. Zero-base nozzles are compared with a moving shroud nozzle which has a substantial annular base area in dry setting. The moving shroud nozzle, as used on the RB199 engine in the Tornado MRCA, is very competitive with zero base nozzles in terms of overall performance. It is light, mechanically simple, reliable, and its short length permits a target type thrust reverser to be used. It is concluded that this type of nozzle is the optimum choice for combat aircraft until further technology advances permit substantial improvements in the overall performace of the more sophisticated nozzles. R.J.F.

N82-13077# Motoren- und Turbinen-Union Muenchen G.m.b.H. (West Germany).

COMPARISON OF DIFFERENT NOZZLE CONCEPTS FOR A REHEATED TURBOFAN

H. Grieb, R. Vedova, H. Enderle, and H. Nagel *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 15 p refs Sponsored in part by German Ministry of Defence

Avail: NTIS HC A22/MF A01

Several concepts of convergent and convergent/divergent nozzles are investigated and compared in view of performance, weight, complexity and the influence on afterbody drag of combat aircraft. The influence of different nozzle cooling concepts on thrust, with subsequent cooling air requirements, is investigated. The optimum ratio of exit area/throat area of convergent/divergent nozzles dependent on nozzle concept and nozzle pressure ratio is identified. The performance comparison shows that fully variable convergent/divergent nozzles promise some advantages against the simple convergent nozzle at high nozzle pressure ratios. However, the higher weight and complexity of convergent/divergent nozzles lead to the conclusion that the choice of convergent/divergent nozzles for reheated turbofan engines in combat aircraft is not generally justified. J.D.H.

AN ACQUISITION AND ANALYSIS SYSTEM FOR DYNAMIC TESTS OF AIR INLETS [SYSTEME D'ACQUISITION ET D'ANALYSE POUR ESSAIS DYNAMIQUES D'ENTREES D'AIR]

Pierre Perrier, Bertrand Delahaye (SNWCMA, Moissy Cramayel, France), and Gerard Laruelle (ONERA, Chatillon, France) *In* AGARD Aerodyn. of Power Plant Installation Aug. 1981 14 p refs In FRENCH

Avail: NTIS HC A22/MF A01

Improving the flight domain of combat aircraft leads to operations involving a much large variation of unsteady aerodynamic characteristics at the engine inlet than in the past. To determine if the augmentation will be effectively acceptable for compressors and engines of the future, sufficient knowledge of flows must be acquired. This entails measuring a sufficient number of unsteady flow characteristics; however, the number of measurements made must be limited because of cost as well as because of the possibility of instantaneous or deferred processing. This sequence of measurements takes into account necessary compromises. Cooperation is needed among the aircraft designer, the engine designer, and the research organization so that the work of each can complement that of the others, and an economy of means and a homogeneity of methods for analyzing and interpreting the results is possible. Transl. by A.R.H.

MODEL TESTING TECHNIQUES FOR MEASURING INLET DRAG

James S. Holdhusen and James L. Grunnet *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 8 p refs

Avail: NTIS HC A22/MF A01

Two methods of measuring inlet drag in transonic flow are described. In the first method, a flow through nacelle is tested in a transonic wind tunnel. Capture ratio is varied by installing individual annular blockers in the nacelle. Corrections for the drag force exerted by the captured streamtube are determined from blow through tests in a static test stand. In the second method, drag is determined directly using a special rig which has a variable loss throttle. The thrust exiting the control surface is determined by a choked ASME nozzle. The advantages and disadvantages of the two methods are compared. E.A.K.

COMPRESSOR STALL INDUCING INSTALLATION EFFECTS OF AN ENGINE CONTROL PARAMETER FOR THE CF-5 AIRCRAFT

W. L. Macmillan, D. M. Rudnitski, and W. Grabe *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 17 p Prepared in cooperation with National Research Council of Canada, Ottawa

Avail: NTIS HC A22/MF A01

Compressor stall problems with CF-5 aircraft powered by two J85-CAN-15 engines were investigated. One major cause for compressor stalls as improper operation of the engines' control system under low temperature conditions was identified. It is demonstrated that this control system malfunction is the result of engine installation effects, which produce an erroneous compressor inlet temperature signal to the main fuel control unit. The degree of signal error for several flight conditions, such as level flight, high angles of attack, aircraft stalls, and weapons delivery profiles are identified. It is found that temperature errors are greater at high angles of attack where severe compressor inlet distortion acts cumulatively in reducing the stall margin under this flight condition. E.A.K.

N82-13086# Vereinigte Flugtechnische Werke G.m.b.H., Bremen (West Germany).

THE ROLE AND IMPLEMENTATION OF DIFFERENT NACELLE/ENGINE SIMULATION CONCEPTS FOR WIND-TUNNEL TESTING IN RESEARCH AND DEVELOPMENT WORK ON TRANSPORT AIRCRAFT

B. Ewald and R. Smyth *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 35 p refs

Avail: NTIS HC A22/MF A01

Different experimental methods and their specific roles in various stages of research and development were investigated. The main problem is the simulation and calibration of the propulsion system. Different simulation methods are: flow through nacelles, powered nacelles (blowing, turbine powered simulators (TPS), ejector powered), inlet models. The TPS represent the most advanced simulation of the high bypass ratio engine in model scale. A large part of the wind tunnel tests still have to rely upon flow through nacelles. A novel flow through nacelle with a variable plug is presented. It is shown that the combination of flow through nacelles and TPS can be efficiently used in the windtunnel investigation of propulsion system effects for transport aircraft. E.A.K.

N82-13087# Office National d'Etudes et de Recherches Aerospatiales, Paris (France).

WIND TUNNEL TESTS OF POWERED MODELS: A COMPARISON OF TWO METHODS OF SIMULATING THE JETS OF JET ENGINES [ESSAIS EN SOUFFLERIE DE MAQUETTES MOTORISEES: COMPARAISON DE DEUX METHODES DE SIMULATION DES JETS DES REACTEURS]

J. P. Becle and R. Perin (SNIAS, Toulouse) *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 18 p ref In FRENCH

Avail: NTIS HC A22/MF A01

Two methods for simulating engine jets were developed at ONERA. The so-called blowing jets were previously mounted for studying the Concorde. The second method, which uses small air breathing turbines was recently installed for Airbus family aircraft. Tests were conducted on semi-models mounted on a balance with six components traversed by the flow from the engine. An original mounting permits the same measurement means to be used for any principle of power or type of test used (fixed point or wind tunnel test). The installations, means of measurement, and methods of using the results are described. The respective advantages of each type of power simulation are considered from the viewpoints of complexity, duration, and precision of measurements obtained. Transl. by A.R.H.

N82-13088# Aircraft Research Association Ltd., Bedford (England).

WIND TUNNEL TEST AND ANALYSIS TECHNIQUES USING POWERED SIMULATORS FOR CIVIL NACELLE INSTALLATION DRAG ASSESSMENT

A. E. Harris and E. C. Carter *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 16 p refs

Avail: NTIS HC A22/MF A01

Full span and semi-span wind tunnel model tests and powered nacelle calibration techniques are discussed in the context of civil nacelle installation drag assessment and optimization. In order to achieve the accuracy required for drag analysis it is necessary to determine the installed net thrust of the powered nacelle simulator to the equivalent of at least one aircraft drag count. This implies stringent control of mass flow and thrust accounting and imposes the need for consistency of approach in the wind-on and calibration tests where thrust and mass flow coefficients must be known to 0.1% to 0.2% accuracy. This need for high confidence in the data at all stages of analysis led to a methodology in which the measured data is combined in various ways to enhance confidence in its final use. Experiences obtained in the use of a Mach simulation tank (MST) for the calibration of turbine powered simulator units are discussed. The MST is used to obtain simultaneous mass flow and thrust calibrations with representative internal nacelle conditions in the presence of a quiescent exhaust environment. Practical problems associated with the design of balance and airfeed arrangements are discussed along with the use of blown and turbine powered simulators. B.W.

ESTABLISHMENT OF AN EXPERIMENTAL TECHNIQUE TO PROVIDE ACCURATE MEASUREMENT OF THE INSTALLED DRAG OF CLOSE COUPLED CIVIL NACELLE/AIRFRAME CONFIGURATIONS, USING A FULL SPAN MODEL WITH TURBINE POWERED ENGINE SIMULATORS
G. Pugh and A. E. Harris (Aircraft Research Association Ltd., Bedford, England) *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 9 p refs

Avail: NTIS HC A22/MF A01
Definition and optimization of installed thrust/drag in civil nacelle installation design and development was studied. As a means of validating the calibration and thrust/drag analysis techniques bodied transport, Lockheed L1011, having high bypass ratio RB 211 turbofan engines with two alternative exhaust system designs was used. Wind tunnel model representation comprised a full span simulation with underwing mounted turbine powered engine simulators. Calibration techniques included the use of a Mach simulation tank in which concurrent mass flow and thrust calibrations were conducted in a quiescent exhaust environment. Data presented includes nacelle thrust and discharge coefficients, installed drag comparisons, and, finally, model to flight correlations. B.W.

EVALUATION OF AN EXPERIMENTAL TECHNIQUE TO INVESTIGATE THE EFFECTS OF THE ENGINE POSITION ON ENGINE/PYLON/WING INTERFERENCE
J. A. J. vanEngelen, B. Munniksma, and A. Elsenaar *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 13 p refs

Avail: NTIS HC A22/MF A01
A flexible experimental technique to study the effect of a variation of engine position for a range of test conditions was evaluated. In this test an underwing mounted 3/4 fancowl engine was investigated at six different positions as a free flow nacelle and as a strut mounted blown nacelle. Pressure and balance force measurements were made. Some typical aspects of the aerodynamic interference are discussed, notably the value of free flow nacelle measurements. Also a comparison of balance weighed and integrated pressure forces is presented. Results indicate that accurate simulation of the engine nozzle geometry is of prime importance for an investigation concerning engine/airframe integration. Nevertheless, tests on a free flow nacelle may still be useful for the selection of the most favourable engine position. A reasonable correlation was established between interference forces as obtained from pressure integration and balance measurements. However, the pressure forces tend to underestimate the balance forces. For a flexible pathfinder test, interference forces derived from pressure integration only appear to be very useful for the determination of trends in interference effects. B.W.

STUDIES OF AIR INLETS AT REYNOLDS NUMBERS COMPARABLE TO FLIGHT IN ONERA'S F1 AND S1MA WIND TUNNELS [ESSAIS DE PRISES D'AIR A DES NOMBRES DE REYNOLDS COMPARABLES AU VOL DANS LES SOUFFLERIES F1 ET S1MA DE L'ONERA]
J. Leynaert *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 12 p refs In FRENCH

Avail: NTIS HC A22/MF A01
The pressurization of the subsonic F1 wind tunnel at ONERA's Fauga-Mauzac Center was a benefit in wind tunnel tests of the air intakes of Airbus-type aircraft on a large scale at a Reynolds number near that of flight. The same model can thus be tested up to a Mach number near 1 in the S1MA wind tunnel at the Modane Center. Air intakes of military aircraft can likewise be studied in the two wind tunnels at high Reynolds numbers. The apparatus used, the methods of measurement, and the means of calibrating and control used to assure valid results are presented. Transl. by A.R.H.

THE INFLUENCE OF CLOSED-COUPLED, REAR FUSELAGE MOUNTED NACELLES ON THE DESIGN OF AN ADVANCED HIGH SPEED WING
R. D. Laugher *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 17 p refs

Avail: NTIS HC A22/MF A01
The design approach aimed at integrating the effect of the nacelle into the basic wing design is described. Particular attention is drawn to the design risk associated with the modified inner wing supercritical flow development when nacelles are not represented in the transonic design calculations. Experimental test results are described which demonstrate the general success of the design technique. Finally, some results are presented from theoretical investigations in which an attempt was made to simulate the interference effect of the nacelle on the wing supercritical flowfield. A technique was developed whereby the nacelle and intake streamtube are replaced by an equivalent interfering body, which is derived from subcritical flow interference pressures. Results show that this technique provides a simple, cost effective tool for the supercritical design of a wing operating in the influence of a rear nacelle. M.D.K.

AERODYNAMIC ASPECTS OF A HIGH BYPASS RATIO ENGINE INSTALLATION ON A FUSELAGE AFTERBODY

N. Voogt, J. vanHengst, and J. Th. v.d.Kolk (NRL) *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 10 p refs

Avail: NTIS HC A22/MF A01
The design process used in shaping rear fuselage mounted large diameter engine nacelles, pylons, and fuselage for a transport type aircraft is described. The objective was to suppress the local velocity levels and pressure gradients to avoid aerodynamic interference drag of the nacelle-pylon-fuselage combination in high speed cruise flight. Shapes of fuselage afterbody, nacelle, and stubwing were modified in a design-by-analysis process involving iterative and three dimensional singularity methods for inviscid subsonic flow. Windtunnel tests confirmed the adequacy of these methods. M.D.K.

A NUMERICAL METHOD FOR STUDYING NACELLE-JET-AIRFOIL INTERACTION IN INVISCID THREE-DIMENSIONAL FLOW [UNE METHODE NUMERIQUE POUR L'ETUDE DE L'INTERACTION NACELLE-JET-VOILURE EN ECOULEMENT TRIDIMENSIONEL NON VISQUEUX]
G. LeGall, J. Bousquet, and M. Yermia *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 13 p refs In FRENCH

Avail: NTIS HC A22/MF A01
The nacelle-jet-airfoil interaction is a complex three dimensional phenomena which is addressed in two simplified hypotheses: the fluid is incompressible and inviscid. Under these two hypotheses, the propulsive configuration is modeled by air intake with flow control and a propulsive jet with control of the pressure generator. A method of singularities is used which considers the sources and doublets of constant density and doublets of linear density on a flat panel. The equations which govern the problem constitute a nonlinear system which is divided into a linear part and a quadratic part. These two parts are solved iteratively by the Gauss-Seidel method and the Newton method. The free bounderies of the flow are also calculated by an iterative process which is integrated into the two preceding methods. Some practical results are proposed in two and three dimensional

flow. Comparison with tests permits evaluation of the advantage of the simplified hypotheses. Transl. by A.R.H.

CALCULATION OF WING-BODY-NACELLE INTERFERENCE IN SUBSONIC AND TRANSONIC POTENTIAL FLOW
K. D. Klevenhusen, H. Jakob, and H. Struck *In* AGARD Aerodyn. in Power Plant Installation Sep. 1981 8 p refs

Avail: NTIS HC A22/MF A01

A calculation method especially for transport aircraft wing design with consideration of wing/body or engine/airframe interference was developed. A hybrid method, consisting of a combination of panel method and finite difference method, is an improvement of a well proved analogy method. The panel method is of higher order using linear source and doublet distributions. The transonic flow region is removed from the entire flow field and the panel method is used for calculating boundary values for the subsequent finite difference method. The finite difference method solves the full potential equation in streamline coordinates. E.A.K.

PREDICTION OF SUBSONIC AIRCRAFT FLOWS WITH JET EXHAUST INTERACTIONS
D. W. Roberts *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 12 p refs

(Contract NAS2-10100)
Avail: NTIS HC A22/MF A01 CSCL 02A

A numerical procedure to calculate the flow fields resulting from the viscous inviscid interactions that occur when a strong jet exhaust and aircraft flow field coupling exists was developed. The approach divides the interaction region into zones which are either predominantly viscous or inviscid. The flow in the inviscid zone, which surrounds most of the aircraft, is calculated using an existing potential flow code. The viscous flow zone, which encompasses the jet plume, is modeled using a parabolized Navier-Stokes code. The procedure features the coupling of the zonal solutions such that sufficient information is transferred between the zones to preserve the effects of the interactions. The zonal boundaries overlap and the boundary conditions are the information link between zones. An iteration scheme iterates the coupled analysis until convergence has been obtained. E.A.K.

PROP-FAN INTEGRATION AT CRUISE SPEEDS
H. Robert Welge *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 14 p refs

Avail: NTIS HC A22/MF A01

The aerodynamic installation features of a highly loaded turboprop (prop fan) on an aircraft for flight at Mach 0.8 are discussed. The aerodynamic flow environment in which the prop fan must operate is shown for both wing and aft-fuselage installations using advanced surface panel methods. The effects of prop fan slipstream parameters on the drag of a supercritical wing are presented indicating that only small drag penalties occur. Drag reductions are possible by tailoring the local wing section to account for the rotor induced flow. Using these inputs, an integrated wing/nacelle is shown. E.A.K.

AIRFRAME-PROPULSION SYSTEM AERODYNAMIC INTERFERENCE PREDICTIONS AT HIGH TRANSONIC MACH NUMBERS INCLUDING OFF-DESIGN ENGINE AIRFLOW EFFECTS
R. M. Kulfan and A. Sigalla *In* AGARD Aerodyn. of Power Plant Installation Sep. 1981 23 p refs

(Contract NAS1-14623)
Avail: NTIS HC A22/MF A01 CSCL 02A

The transonic speed regime for airplanes at conditions where inlet spillage takes place is discussed. A wind tunnel test program to evaluate aerodynamic performance penalties associated with propulsion system installation and operation at subsonic through low supersonic speeds was conducted. The accuracy of analytic methods for predicting transonic engine airframe interference effects was assessed. Study variables included Mach number, angle of attack, relative cowl location, and nacelle mass flow ratio. Results include test theory comparisons of forces as well as induced pressure fields. Prediction capability of induced shock wave strength and locations is assessed. It was found that large interference forces due to engine location and flow spillage occur at transonic speeds, that theory explains these effects; and that theory can predict quantitatively these effects. TURBULENT WAKE DEVELOPMENT BEHIND STREAMLINED BODIES Ph.D. Thesis
Sastry Suryanarayana Munukutla 1981 316 p
Avail: Univ. Microfilms Order No. 8123346

The developing turbulent wake behind streamlined bodies is reported. Detailed measurements of mean and turbulent flow properties are made in three different wake flows. The first is the symmetric wake of a flat plate, the second is the asymmetric wake of a flat plate, (asymmetry being produced by roughening on side of the plate) and the third is the curved wake of an asymmetric airfoil at incidence. It is possible to identify three important regions in the wake, namely the near wake, intermediate wake and the far wake. The performance of the existing turbulence models in the case of the symmetric flat plate wake is studied. The near and intermediate wake regions are predicted by a sophisticated turbulence model. FORCE AND MOMENT, FLOW-VISUALIZATION, AND BOUNDARY-LAYER TESTS ON A SHUTTLE ORBITER MODEL AT MACH 6
Robert L. Calloway Dec. 1981 25 p refs
(NASA-TP-1952; L-14782) Avail: NTIS HC A02/MF A01 CSCL 01A

Force and moment, flow visualization, and boundary layer state tests were conducted using two 0.004 scale shuttle orbiter models. The force and moment tests were conducted for an angle of attack range from 20 to 40 deg and for Reynolds numbers based on reference length from 0.4 million to 3.6 million. Schlieren photographs were obtained for each angle of attack and Reynolds number. The boundary layer state tests, which were conducted using hot film sensors mounted in a separate model, were conducted over the same range of conditions as the force tests. Test results were combined to show that changes in the boundary layer on a typical hypersonic force test model affect measurement of the axial force coefficient and that the state of the local boundary layer is important for interpreting hypersonic aerodynamic test results. WIND-TUNNEL INVESTIGATION OF THE EFFECTS OF BLADE TIP GEOMETRY ON THE INTERACTION OF TORSIONAL LOADS AND PERFORMANCE FOR AN ARTICULATED HELICOPTER ROTOR
William T. Yeager and Wayne R. Mantay Dec. 1981 64 p refs Prepared in cooperation with Army Aviation Research and Development Command, Hampton, Va.
(DA Proj. 1L2-62209-AH-76)
(NASA-TP-1926; AVRADCOM-TR-81-B-5; L-14674) Avail: NTIS HC A04/MF A01 CSCL 01A

The Langley transonic dynamics tunnel was used to determine the degree of correlation between rotor performance and the dynamic twist generated by changes in blade tip geometry using an articulated rotor with four different tip geometries at advance ratios of 0.20, 0.30 and 0.35. Based on the data obtained, it is concluded that: (1) there appears to be no strong correlation between blade torsion loads and rotor performance prediction; (2) for a given rotor task at each advance ratio investigated, both the azimuthal variation of torsional moment and the mean torsional moment at 81% radius are configuration dependent; (3) reducing the nose down twist on the advancing blade appears to be more important to forward flight performance than increasing the nose down twist on the retreating blade; (4) the rotor inflow model used was important in predicting the performance of the adaptive rotor; and (5) neither rigid blade solidity effects, inflow environment, nor blade torsion loads can be used alone to accurately predict active rotor performance.

AN AERODYNAMIC DESIGN AND THE OVERALL STAGE

PERFORMANCE OF AN AIR-COOLED AXIAL-FLOW TURBINE

Atsumasa Yamamoto, Kitao Takahara, Hiroyuki Nouse, Shigeo Inoue, Hiroschi Usui, and Fugio Mimura Jan. 1981 44 p refs
(NAL-TR-321T) Avail: NTIS HC A03/MF A01

In order to investigate air-cooled turbines for application to high-temperature engines, a single stage turbine with a 0.56-m (22-inch) tip diameter was designed. The aerodynamical design procedures of the turbine are presented. The stator and rotor blades are characterized by low blade solidity, thick blade section, blunt leading edge and trailing edge, and low blade aspect ratio. A cold air test without supply of cooling air was conducted to determine the turbine aerodynamic performance. The highest efficiency obtained over the range of conditions investigated was 0.865. The turbine satisfied the equivalent design value of specific work output at the design condition (i.e., at equivalent design speed and equivalent design pressure ratio) with an efficiency of 0.856. Detailed surveys of rotor-outlet gas flow were made with Pitot tubes and temperature sensors and the results are also presented. T.M.

THRUST MODULATION METHODS FOR A SUBSONIC V/STOL AIRCRAFT

Richard R. Woollett 1981 16 p refs Presented at V/STOL Conf., Palo Alto, Calif., 7-9 Dec. 1981; sponsored by AIAA and NASA Ames
(NASA-TM-82747; E-1063) Avail: NTIS HC A02/MF A01 CSCL 01A

Low speed wind tunnel tests were conducted to assess four methods for attaining thrust modulation for V/STOL aircraft. The four methods were: (1) fan speed change, (2) fan nozzle exit area change, (3) variable pitch rotor (VPR) fan, and (4) variable inlet guide vanes (VIGV). The interrelationships between inlet and thrust modulation system were also investigated using a double slotted inlet and thick lip inlet. Results can be summarized as: (1) the VPR and VIGV systems were the most promising, (2) changes in blade angle to obtain changes in fan thrust have significant implications for the inlet, and (3) both systems attained required level of thrust with acceptable levels of fan blade stress. A CALCULATION METHOD FOR SLENDER WING-BODY CONFIGURATIONS IN SUPERSONIC FLOW AT HIGH ANGLES OF ATTACK [EIN BERECHNUNGSVERFAHREN FUER SCHLANKE FLUEGEL-RUMPFANORDNUNGEN IM UEBERSCHALL BEI HOHEN ANSTELLWINKELN]

D. Nikolitsch Bonn Bundesministerium der Verteidigung 1979 58 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium der Verteidigung
(BMVg-FBWT-79-15) Avail: NTIS HC A04/MF A01; DOK-ZENTBw, Bonn DM 30

An analysis which determines nonlinear force and pitching moment characteristics of slender bodies and slender wing-body configurations at high angles of attack in supersonic flow is presented. The linear coefficients of the body are calculated by means of a singularity distribution along the body axis. The nonlinear coefficients are determined by a method based on Wardlaw's multivortex model which is modified so that it is applicable at Mach > 1. The wing characteristics are calculated with the Huerlimann prediction method; this method is limited to slender, tapered wing planforms. The mutual interference of wing and body is accounted for by Nielsen interference factors. The range of application of the analysis is exemplified by sample calculations. Author (ESA)

GROUP 1: SCENARIO DESIGN AND DEVELOPMENT ISSUES

Peter Sherwin *In its* Guidelines for Line-oriented Flight Training, Vol. 2 1981 p 113-117

Avail: NTIS HC A08/MF A01 CSCL 05I

All LOFT scenarios and flight segments should be designed on the basis of a detailed statement of specific objectives. These objectives must state what kind of situation is to be addressed and why. The origin, routing, and destination of a particular scenario should be dictated by the specific objectives for that scenario or leg. Other factors to be considered are the desired weather, climate, etc. Simulator visual system, as well as other capabilities and limitations must be considered at a very early stage of scenario design. The simulator navigation area must be apropriate and must coincide with current Jeppeson charts. Much of the realism of LOFT is destroyed if the crew is unable to use current manuals and other materials. A.R.H.

TECHNIQUES FOR INTERFACING MULTIPLEX SYSTEMS Final Report, 10 Sep. 1979 - 10 May 1980

James P. Gross Feb. 1981 138 p
(Contract F33615-79-C-1876; AF Proj. 2003)
(AD-A101457; AFWAL-TR-80-1223) Avail: NTIS HC A07/MF A01 CSCL 17/2

Data describing the characteristics of a number of aircraft multiplex systems were collected and compiled. Although Air Force aircraft received priority, were consideration was also given to other military and commercial aircraft. The F-16, B-52 OAS, YAH-64, F-18, F-15 and ARINC 575 systems were included. MIL-STD-1553B was used as a baseline for comparison. The compiled data was analyzed to determine points of incompatibility between these systems and a feasibility study was performed to assess possible techniques to be used in achieving bus compatibility. A programmable interface module design philosophy is recommended which utilizes a distributed three-microprocessor arrangement to achieve the desired interface compatibility. The three-processor conept allows three independent software-controlled events to occur simultaneously, thus providing an extremely high degree of flexibility both for existing systems and for future growth. SYSTEM IDENTIFICATION HELICOPTER PARAMETERS. DETERMINATION FROM FLIGHT TESTS, PHASE 2 [SYSTEMIDENTIFIZIERUNG DREHFLUEGLER KENNWERT-ERMITTLUNG AUS FLUGMESSUNGEN (PHASE 2)]
M. Kloster and S. Attlfellner Bonn Bundesministerium der Verteidigung 1980 92 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium der Verteidigung
(BMVg-FBWT-80-12) Avail: NTIS HC A05/MF A01; DOKZENTw, Bonn DM 30

A parameter identification program for a hingeless rotor helicopter is considered. Flight conditions were selected with increasing instability, i.e., hover and level flight at maximum speed; with maximum weight and with a rearward center of gravity. A strap down system was chosen to provide the attitude feedback control necessary for proper identification. The control input signals were optimized for the unstabilized helicopter. Calculations in the time and frequency domains show that special distributions in the power spectrum of the input signals are needed for optimizing the closed loop system. The identified derivatives and the smoothened time histories from flight tests are compared with the identification results of linear and nonlinear simulations and of the quasistatic theory. MANEUVER LOAD CONTROL FOR THE REDUCTION OF DESIGN LOADS AND IMPROVEMENT OF THE MANEUVERABILITY OF MODERN FIGHTER AIRCRAFT
Horst Balke Bonn Bundesministerium der Verteidigung 1981 283 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium der Verteidigung
(BMVg-FBWT-81-2) Avail: NTIS HC A13/MF A01; DOKZENTBw, Bonn DM 50

Active control technology is applied and the feasibility of design load reduction is analyzed. The influence of direct force control on aircraft component loads and on aircraft maneuverability is seen. The deflection of secondary control surfaces in proportion with the commanded control surface was investigated in an open loop control system. Load reduction efficiency diagrams and tables are presented. A comparison of two different aircraft shows that with an open loop control system a considerable reduction in design load is possible. The loads acting on several aircraft components for different open loop control systems are compared. Several closed loop control systems with aircraft response feedback parameters were also investigated. The results are again presented as diagrams, and tables. Only in some cases does closed loop control achieve better results than open loop control. The best design load reduction is achieved with a combined open and closed loop control system. The investigation results are comprehensively evaluated and the parameters relevant for design load reduction are summarized. Author (ESA)

PRACTICAL ASPECTS OF INSTRUMENTATION SYSTEM INSTALLATION, VOLUME 13
R. W. Borek, A. Pool, ed., and K. C. Sanderson, ed. Sep. 1981 197 p refs
(NASA-TM-84067; AGARD-AG-160-Vol-13;
ISBN-92-835-1399-1) Avail: NTIS HC A09/MF A01 CSCL 01D

A review of factors influencing installation of aircraft flight test instrumentation is presented. Requirements, including such factors as environment, reliability, maintainability, and system safety are discussed. The assessment of the mission profile is followed by an overview of electrical and mechanical installation factors with emphasis on shock/vibraion isolation systems and standardization of the electric wiring installation, two factors often overlooked by instrumentation engineers. A discussion of installation hardware reviews the performance capabilities of wiring, connectors, fuses and circuit breakers, and a guide to proper selections is provided. The discussion of the installation is primarily concerned with the electrical wire routing, shield terminations and grounding. Also inclued are some examples of installation mistakes that could affect system accuracy. System verification procedures and special considerations such as sneak circuits, pyrotechnics, aircraft antenna patterns, and lightning strikes are discussed. M.D.K.

NUMERICAL ANALYSIS OF THE SCRAMJET-INLET FLOW FIELD BY USING TWO-DIMENSIONAL NAVIER-STOKES EQUATIONS
Ajay Kumar Dec. 1981 30 p refs
(NASA-TP-1940; L-14776) Avail: NTIS HC A03/MF A01 CSCL 21E

A computer code was developed to solve the full two dimensional Navier-Stokes equations in a supersonic combustion ramjet (scramjet) inlet. In order to be able to consider a general inlet geometry with embedded bodies, a numerical coordinate transformation is used which generates a set of boundary-fitted curvilinear coordinates. The explicit finite difference algorithm of MacCormack is used to solve the governing equations. An algebraic, two-layer eddy-viscosity model is used for the turbulent flow. The code can analyze both inviscid and viscous flows with no strut, one strut, or multiple struts in the flow field. The application of the two dimensional analysis in the preliminary parametric design studies of a scramjet inlet is discussed. Detailed results are presented for one model problem and for several actual scramjet-inlet configurations. R.J.F.

EFFECT OF FUEL-AIR-RATIO NONUNIFORMITY ON EMISSIONS OF NITROGEN OXIDES
Valerie J. Lyons Nov. 1981 14 p refs
(NASA-TP-1798; E-648) Avail: NTIS HC A02/MF A01 CSCL 21E

The inlet fuel-air ratio nonuniformity is studied to deterine how nitrogen oxide (NOx) emissions are affected. An increase in NOx emissions with increased fuel-air ratio nonuniformity for average equivalence ratios less than 0.7 and a decrease in NOx emissions for average equivalence ratios near stoichiometric is predicted. The degree of uniformityy of fuel-air ratio profiles that is necessary to achieve NOx emissions goals for actual engines that use lean, premixed, prevaporized combustion systems is determined. S.L.

A REAL TIME PEGASUS PROPULSION SYSTEM MODEL FOR VSTOL PILOTED SIMULATION EVALUATION

James R. Mihaloew, Stephen P. Roth (Pratt and Whitney Aircraft Group, West Palm Beach, Fla.), and Robert Creekmore (Pratt and Whitney Aircraft Group, West Palm Beach, Fla.) 1981 18 p refs Presented at VSTOL Conf., Palo Alto, Calif., 7-9 Dec. 1981; sponsored by AIAA and NASA. Ames Research Center
(NASA-TM-82770; E-1004; AIAA-81-2663) Avail: NTIS HC A02/MF A01 CSCL 21E

A real time propulsion system modeling technique suitable for use in man-in-the-loop simulator studies was developed. This technique provides the system accuracy, stability, and transient response required for integrated aircraft and propulsion control system studies. A Pegasus-Harrier propulsion system was selected as a baseline for developing mathematical modeling and simulation techniques for VSTOL. Initially, static and dynamic propulsion system characteristics were modeled in detail to form a nonlinear aerothermodynamic digital computer simulation of a Pegasus engine. From this high fidelity simulation, a real time propulsion model was formulated by applying a piece-wise linear state variable methodology. A hydromechanical and water injection control system was also simulated. The real time dynamic model includes the detail and flexibility required for the evaluation of critical control parameters and propulsion component limits over a limited flight envelope. The model was programmed for interfacing with a Harrier aircraft simulation. Typical propulsion system simulation results are presented. M.D.K.

SENSOR FAILURE DETECTION SYSTEM Final Report

E. C. Beattie, R. F. LaPrad, M. E. McGlone, S. M. Rock, and M. M. Akhter Aug. 1981 172 p refs Prepared in cooperation with Systems Control, Inc., Palo Alto, Calif.
(Contract NAS3-22481)
(NASA-CR-165515; PWA-5736-17) Avail: NTIS HC A08/MF A01 CSCL 21E

Advanced concepts for detecting, isolating, and accommodating sensor failures were studied to determine their applicability to the gas turbine control problem. Five concepts were formulated based upon such techniques as Kalman filters and a screening process led to the selection of one advanced concept for further evaluation. The selected advanced concept uses a Kalman filter to generate residuals, a weighted sum square residuals technique to detect soft failures, likelihood ratio testing of a bank of Kalman filters for isolation, and reconfiguring of the normal mode Kalman filter by eliminating the failed input to accommodate the failure. The advanced concept was compared to a baseline parameter synthesis technique. The advanced concept was shown to be a viable concept for detecting, isolating, and accommodating sensor failures for the gas turbine applications. M.G.

NASA RESEARCH IN AIRCRAFT PROPULSION

Milton A. Beheim 1982 17 p Proposed for presentation at the 27th Ann. Intern. Gas Turbine Conf., London, 18-22 Apr. 1982; sponsored by ASME
(NASA-TM-82771; E-1096) Avail: NTIS HC A02/MF A01 CSCL 21E

A broad overview of the scope of research presently being supported by NASA in aircraft propulsion is presented with emphasis on Lewis Research Center activities related to civil air transports, CTOL and V/STOL systems. Aircraft systems work is performed to identify the requirements for the propulsion system that enhance the mission capabilities of the aircraft. This important source of innovation and creativity drives the direction of propulsion research. In a companion effort, component research of a generic nature is performed to provide a better basis for design and provides an evolutionary process for technological growth that increases the capabilities of all types of aircraft. Both are important. A.R.H.

DESIGN FOR ACTIVE AND PASSIVE FLUTTER SUPPRESSION AND GUST ALLEVIATION Ph.D. Thesis

Mordechay Karpel Washington NASA Nov. 1981 117 p refs
(Grant NGL-05-020-243)
(NASA-CR-3482) Avail: NTIS HC A06/MF A01 CSCL 01C

Analytical design techniques for active and passive control of aeroelastic systems are based on a rational approximation of the unsteady aerodynamic loads in the entire Laplace domain, which yields matrix equations of motion with constant coefficients. Some existing schemes are reviewed, the matrix Pade approximant is modified, and a technique which yields a minimal number of augmented states for a desired accuracy is presented. The state-space aeroelastic model is used to design an active control system for simultaneous flutter suppression and gust alleviation. The design target is for a continuous controller which transfers some measurements taken on the vehicle to a control command applied to a control surface. Structural modifications are formulated in a way which enables the treatment of passive flutter suppression system with the same procedures by which active control systems are designed. A.R.H.

LIMITED EVALUATION OF AN F-14A AIRPLANE UTILIZING AN AILERON-RUDDER INTERCONNECT CONTROL SYSTEM IN THE LANDING CONFIGURATION

Wendell W. Kelley and Einar K. Enevoldson (NASA. Dryden Flight Research Center) Dec. 1981 39 p refs
(NASA-TM-81972; L-14756) Avail: NTIS HC A03/MF A01 CSCL 01C

A flight test was conducted for preliminary evaluation of an aileron-rudder interconnect (ARI) control system for the F-14A airplane in the landing configuration. Two ARI configurations were tested in addition to the standard F-14 flight control system. Results of the flight test showed marked improvement in handling qualities when the ARI systems were used. Sideslip due to adverse yaw was considerably reduced and airplane turn rate was more responsive to pilot lateral control inputs. Pilot comments substantiated the flight data and indicated that the ARI systems were superior to the standard control system in terms of pilot capability to make lateral offset corrections and heading changes on final approach. ANALYSIS OF A LONGITUDINAL PILOT-INDUCED OSCILLATION EXPERIENCED ON THE APPROACH AND LANDING TEST OF THE SPACE SHUTTLE

John W. Smith Dec. 1981 45 p refs
(NASA-TM-81366) Avail: NTIS HC A03/MF A01 CSCL 05H

During the final free flight (FF-5) of the shuttle's approach and landing tests, the vehicle experienced pilot-induced oscillations near touchdown. The flight test data showed that pilot inputs to the hand controller reached peak-to-peak amplitudes of 20 deg at a frequency between 3 and 3.5 radians per second. The controller inputs were sufficient to exceed the priority rate limit set in the pitch axis. A nonlinear analytical study was conducted to investigate the combined effects of pilot input, rate limiting, and time delays. The frequency response of the total system is presented parametrically as a function of the three variables. In general, with no dead time, for controller inputs of 5 deg or less, the total system behaves in a linear fashion. For 10 deg of controller input, independent of the delay time, the elevon loop will be rate saturated above a frequency of 4 radians per second. Author

DEVELOPMENT AND TESTING OF DRY CHEMICALS IN ADVANCED EXTINGUISHING SYSTEMS FOR JET ENGINE NACELLE FIRES Final Report
Robert L. Altman, A. Campbell Ling, ed., Ludwig A. Mayer, and Donald J. Myronik Sep. 1979 314 p
(Grant NsG-2165)
(NASA-CR-165011) Avail: NTIS HC A14/MF A01 CSCL 21B

The effectiveness of dry chemical in extinguishing and delaying reignition of fires resulting from hydrocarbon fuel leaking onto heated surfaces such as can occur in jet engine nacelles is studied. The commercial fire extinguishant dry chemical tried are sodium and potassium bicarbonate, carbonate, chloride, carbamate (Monnex), metal halogen, and metal hydroxycarbonate compounds. Synthetic and preparative procedures for new materials developed, a new concept of fire control by dry chemical agents, descriptions of experiment assemblages to test dry chemical fire extinguishant efficiencies in controlling fuel fires initiated by hot surfaces, comparative testing data for more than 25 chemical systems in a 'static' assemblage with no air flow across the heated surface, and similar comparative data for more than ten compounds in a dynamic system with air flows up to 350 ft/sec are presented. S.L.

MEASURED PAVEMENT RESPONSE TO TRANSIENT AIRCRAFT LOADINGS Ph.D. Thesis
Thomas Dale White 1981 243 p
Avail: Univ. Microfilms Order No. 8123723

Pavement deformation response to aircraft traffic was studied. Linear variable differential transducers (LVDT's) were installed in an active taxiway. The LVDT's were attached to reference rods anchored at 16, 36, 120, and 209 in. Basic pavement responses, information on how pavement layers accommodate dynamic loads, as well as data to compare vertical deformations predicted by a theoretical model were examined. A finite difference solution was used to predict pavement temperatures. The solution is shown to have limited application for predicting pavement temperatures. The pavement response phenomena reported are significant. They expose pavement responses that have been minimized in past research but must now be considered. Current theoretical models used in pavement analysis or design are limited in predicting pavement response phenomena. They do not represent the observed compression and extension in a pavement under and away from actual aircraft loads. Dissert. Abstr.

STRUCTURAL DYNAMICS: MODIFIED CALCULATIONS
G. Hornung and H. Roehrle Bonn Bundesministerium der Verteidigung 1981 83 p refs In GERMAN; ENGLISH summary
Sponsored by Bundesministerium der Verteidigung
(BMVg-FBWT-81-1) Avail: NTIS HC A05/MF A01; DOKZENTBw, Bonn DM 30

Calculation methods which give natural and harmonically excited vibrations of modified structures, using the results of the original systems, are presented and tested. Most of the methods are based on a linear approximation, i.e., the individual terms of the equations of motion are subdivided into those of the original system and into corresponding difference terms whose products are subsequently neglected. Tests are carried out for simple models as well as for three-dimensionally idealized wing and aircraft structures. Concerning natural vibrations, it is difficult to estimate the achieved accuracy without knowing the exact results. The applied methods are Wielandt iteration and subspace iteration. Using the original natural modes as starting vectors leads to a considerable reduction in computation cost, even with severe modifications. Application of the linear approximation is shown for the reduction of the number of degrees of freedom, which precedes dynamic analysis. Author (ESA)

PREDICTION OF AERODYNAMIC LOADS ON AIRCRAFTS WITH EXTERNAL STORES AT TRANSONIC SPEEDS Ph.D. Thesis
Chandrasekaran Balasubramanyan 1981 204 p
Avail: Univ. Microfilms Order No. 8123139

The integral equation method was applied to calculate the pressure distribution over an arbitrary, three dimensional lifting wing and a three dimensional wing with an external store, kept beneath the wing. A method to calculate the interference effects imposed by an external store on the wing and vice-versa is given. The wing along transonic solution is analyzed and compared with the experimental results and as well as a wing with an external store. A theory for the flow field nonlinear velocity prediction is developed, programmed, and applied to a wing with an external store configuration and the flow field velocities are compared with the experimental results. The numerical methods for solving the triple and double integrals with limits to infinity are studied and the application of one such method to the flow field prediction problem is briefly indicated. Further extension of this work is indicated with the limitations and advantages. Dissert. Abstr.

INVESTIGATION OF ACOUSTIC INTERACTIONS IN JET THRUST AUGMENTING EJECTORS Final Report, 1 Jan. 1979 - 30 Sep. 1980
J. R. Campbell, K. D. Korkan (Ohio State Univ., Columbus), and H. Viets (Wright State Univ.) 5 Mar. 1981 244 p refs
(Contract N00019-79-C-0225)
(AD-A106083; NR80H-50) Avail: NTIS HC A11/MF A01 CSCL 20/1

The performance of a constant area rectangular ejector with varying mixing length was investigated to determine the aeroacoustic interaction effects. The rectangular ejector investigation was conducted in two phases. The phase one investigation involved the testing of three different aspect ratio rectangular convergent nozzles at pressures between 15-45 psig to determine the acoustic and jet spreading characteristics. From these data a rectangular ejector incorporating endwall and ejector flap blowing was fabricated and investigated at pressure ratios between 2.0 and 5.0. These investigations were conducted at ejector flap length (L) to ejector throat widths (W), L/W of 11.0, 9.5, 8.0, 6.5, 5.0, 3.5, 2.0, and 0.9 to determine the ejector performance. The data for the rectangular ejector configuration investigated showed an aeroacoustic interaction in the present ratio range of 3.3 - 3.8. However, the resulting performance was not improved to the degree experienced with axisymmetric ejectors. Author (GRA)

EFFECT OF VACUUM EXHAUST PRESSURE ON THE PERFORMANCE OF MHD DUCTS AT HIGH B-FIELD
J. Marlin Smith, J. L. Morgan, and Shih-Ying Wang 1982 13 p refs Presented at the 20th Aerospace Sci. Meeting, Orlando, Fla., 11-14 Jan. 1982; sponsored by AIAA
(Contract DE-AI01-77ET-10769)
(NASA-TM-82750; DOE/NASA/10769-23; E-1066) Avail: NTIS HC A02/MF A01 CSCL 20I

The effect of area ratio variation on the performance of a supersonic Hall MHD duct is investigated. Results indicate that for a given combustion pressure there exists an area ratio below which the power generating region of the duct is shock free and the power output increases linearly with the square of the magnetic field. For area ratios greater than this, a shock forms in the power generating region which moves upstream with increasing magnetic field strength resulting in a less rapid raise in the power output. The shock can be moved downstream by either increasing the combustion pressure of decreasing the exhaust pressure. The influence of these effects upon duct performance is presented. B.W.

Support investment costs and recurring operations and support costs are through determined using a model for estimating aircraft cost of ownership (MACO), which also provides a framework for future research. An outgrowth of an earlier evaluation of the strengths and weaknesses of the most widely used aircraft life cycle cost models, MACO combines algorithms for major, maintenance related costs with formulas drawn from existing models for other cost elements. A full set of ownership cost elements is related to component level reliability and maintainability characteristics and to aircraft design, operations, logistics, and deployment parameters. Resource quantities are computed in units that can be related directly to Air Force programming categories, including base maintenance manning (by work center), depot manning, and recoverable spares inventory levels. Output and input parameters accommodate annual changes in system parameters and operating conditions such as component reliability and aircraft inventory size and activity rates. Author

AFTERBODIES
An investigation of F-16 nozzle-afterbody forces at transonic Mach numbers with emphasis on model scale effects
[AD-A104905] N82-12392
Aerodynamics of Power Plant Installation
[AGARD-CP-301] N82-13065
Aerodynamic aspects of a high bypass ratio engine installation on a fuselage afterbody
N82-13093

AGRICULTURAL AIRCRAFT
Raven aircraft filter-absorber --- agricultural aircraft
[AD-A098962] N82-13139

AH-64 HELICOPTER
The TADS/PNVS 'eyes' for the AH-64 attack helicopter
A82-13239

AILERONS
Trim tab excitation system for the BAe 146
A82-14363
Limited evaluation of an F-14A airplane utilizing an aileron-rudder interconnect control system in the landing configuration
[NASA-TM-81972] N82-13148

AIR COOLING
The operational characteristics of turbojets, giving particular attention to the cooled high-pressure turbine
A82-14414
An aerodynamic design and the overall stage performance of an air-cooled axial-flow turbine
[NAL-TR-321T] N82-13109

AIR CUSHION LANDING SYSTEMS
Experimental and analytical studies of advanced air cushion landing systems
[NASA-CR-3476] N82-12065

AIR FILTERS
Raven aircraft filter-absorber --- agricultural aircraft
[AD-A098962] N82-13139

AIR FLOW
Experimental investigation of total pressure loss and airflow distribution for gas turbine combustors
A82-15606
A vapour cycle cabin cooling system for the Sea King MK.50 helicopter
[AD-A105211] N82-12069

AIR INTAKES
Transonic flows in an air inlet with large incidence and the effect of a blowing trap
N82-13071
An acquisition and analysis system for dynamic tests of air inlets
N82-13082
Studies of air inlets at Reynolds numbers comparable to flight in CNERA's F1 and S1MA wind tunnels
N82-13091
Airframe-propulsion system aerodynamic interference predictions at high transonic Mach numbers including off-design engine airflow effects
N82-13098

AIR NAVIGATION
Fuel efficient flight profiles in an ATC flow management environment
A82-13070
An update of an integrated CNI system - TIES --- Communication, Navigation, and Identification provided by Tactical Information Exchange System
[AIAA 81-2292] A82-13500
Time-referencing of data in an asynchronous environment --- for fighter aircraft avionics
[AIAA 81-2341] A82-13531
A Loran-C prototype navigation receiver for general aviation
[AIAA 81-2329] A82-13532
Estimation of the efficiency of radioelectronic flight navigation systems
A82-13701
Instrumentation to determine the suitability of RNAV systems for helicopter navigation in the national airspace system /NAS/
[AIAA PAPER 81-2514] A82-13911
Navstar Global Positioning System flight test program overview
[AIAA PAPER 81-2350] A82-13956
Evaluating sources of error in EAR/GEANS navigation using a Kalman postprocessor --- Electronically Agile Radar/Gimbaled Electrically suspended gyro Airborne Navigation System
A82-14739
The agile transversal filter - A flexible building block for ICNIA --- Integrated Communications, Navigation and Identification Avionics
A82-14765
Application of multiple model estimation techniques to a recursive terrain height correlation system
A82-14768
Technical/operational ATC scenarios for future TMA navigation
A82-14774
The LANTIRN wide field-of-view raster Head-Up Display --- Low Altitude Navigation and Targeting IR for Night
A82-14825

AIR TO AIR MISSILES
Integrated Flight/Weapon Control design and evaluation
A82-14741

AIR TO AIR REFUELING
KC-10, flight test program management - The contractor's viewpoint
[AIAA PAPER 81-2380] A82-14384

AIR TO SURFACE MISSILES
Integrated Flight/Weapon Control design and evaluation
A82-14741

AIR TRAFFIC CONTROL
Fuel efficient flight profiles in an ATC flow management environment
A82-13070
Technical/operational ATC scenarios for future TMA navigation
A82-14774
Some Italian research for developing new primary ATC radars
A82-14775
Performance evaluation of target report extractor in the monopulse ATCRBS --- Air Traffic Control Radar Beacon System
A82-14776
A multimicroprocessor system for ATCRBS monopulse data processing
A82-14777
A new approach to radar plot extraction for ATC applications
A82-14908
Extended time radar raw video recording
A82-14909
Large terminal maneuvering areas: Operational problems - Possible development of solutions
A82-15625
Computer-animated predictive displays for microwave landing approaches
A82-15816
Orienting description of air traffic control in the Netherlands
[VTH-LR-285] N82-12063
Moving target Detector/Airport Surveillance radar (ASR-7) field evaluation
[AD-A105196] N82-12303

AIR TRANSPORTATION
Transportation systems evaluation methodology development and applications, phase 3 [NASA-CR-164999] N82-12051

AIRBORNE EQUIPMENT
On-board communication for active-control transport aircraft [AIAA 81-2321] A82-13520
Detection range analysis of an airborne medium PRF radar A82-14723
Airborne Electronic Terrain Map System A82-14771
Airborne Electronic Terrain Map System. II - Applications A82-14773
Commercial airborne weather radar technology A82-14868
High voltage/high power for airborne applications A82-15918

AIRBORNE SURVEILLANCE RADAR
Air-to-ground MTI radar using a displaced phase center, phased array A82-14881

AIRBORNE/SPACEBORNE COMPUTERS
Fuel efficient flight profiles in an ATC flow management environment A82-13078
Integrated avionics - Concepts and concerns [AIAA 81-2211] A82-13452
F/A-18A weapon system - 1976 state of the art [AIAA 81-2215] A82-13453
Digital avionics - What a pilot expects to see [AIAA 81-2217] A82-13455
Applications of digital avionics to commercial transport aircraft - The DC-9 Super 80 and beyond [AIAA 81-2218] A82-13456
The role of avionics in the all electric airplane [AIAA 81-2219] A82-13457
Computer-in-control selection logic for a triplex digital flight control system [AIAA 81-2236] A82-13465
Design and analysis of a digitally controlled integrated flight/fire control system [AIAA 81-2245] A82-13470
Joint Tactical Microwave Landing System /JTMLS/ airborne signal processing [AIAA 81-2247] A82-13471
LHX - An advanced avionics system design [AIAA 81-2249] A82-13472
The SIFT computer and its development --- Software Implemented Fault Tolerance for aircraft control [AIAA 81-2278] A82-13490
The electronic terrain map - A new avionics integrator [AIAA 81-2289] A82-13498
An update of an integrated CNI system - TIES --- Communication, Navigation, and Identification provided by Tactical Information Exchange System [AIAA 81-2292] A82-13500
Digital avionics display processor [AIAA 81-2311] A82-13513
Advanced display systems for crew stations of tactical aircraft [AIAA 81-2312] A82-13514
An advanced programmable/reconfigurable color graphics display system for crew station technology research [AIAA 81-2314] A82-13516
Higher order Information Transfer Systems are coming [AIAA 81-2317] A82-13517
Advanced weapon systems - Integration technology --- Digital Avionic Information System [AIAA 81-2213] A82-13533
Flight experience with a remotely augmented vehicle flight test technique [AIAA PAPER 81-2417] A82-13857
The need for, and development of, a simulation facility at the Naval Air Test Center [AIAA PAPER 81-2488] A82-13917
The development and flight test evaluation of an integrated propulsion control system for the HiMAT research airplane [AIAA PAPER 81-2467] A82-13931
The development and use of a computer-interactive data acquisition and display system in a flight environment [AIAA PAPER 81-2371] A82-13946
Lockheed Airborne Data System - Distributed microcomputers provide on-board real-time analysis [AIAA PAPER 81-2367] A82-13949
NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volumes 1, 2 & 3 A82-14676
Computational considerations for fusion in target identification systems --- multisensor correlation A82-14735
Software considerations in the design of computer generated flight displays A82-14742
The influence of smart computers on the cockpit of the future A82-14743
Algorithms for an adaptive dynamic window in electronic map systems A82-14769
Airborne Electronic Map Systems. I - Design A82-14770
Flight management systems for modern jet aircraft A82-14778
Design of direct digital flight-mode control systems for high-performance aircraft A82-14829

AIRCRAFT
Computer-animated predictive displays for microwave landing approaches A82-15816
The impact of new guidance and control systems on military aircraft cockpit design [AGARD-CP-312] N82-13048
Prediction of aerodynamic loads on aircrafts with external stores at transonic speeds N82-13813

AIRCRAFT ACCIDENT INVESTIGATION
Extended time radar raw video recording A82-14909
A matter of seconds - A critical account of three notable air disasters /5th Major Miller Memorial Lecture/ A82-15597
Investigation of severe lightning strike incidents to two USAF F-106A aircraft [NASA-CR-165794] N82-12052
Summary of Federal Aviation Administration responses to National Transportation Safety Board safety recommendations [AD-A104922] N82-12055

AIRCRAFT ACCIDENTS
HASEP - Survival from crashed Navy helicopters A82-14977
Post ejection survival A82-14981
A matter of seconds - A critical account of three notable air disasters /5th Major Miller Memorial Lecture/ A82-15597

AIRCRAFT ANTENNAS
Study of the effects of maneuver compensation on beam pointing accuracy A82-14780

AIRCRAFT APPROACH SPACING
Aircraft separation assurance avionics [AIAA 81-2239] A82-13467
Large terminal maneuvering areas: Operational problems - Possible development of solutions A82-15625

AIRCRAFT CARRIERS
Commentary on facilities used in the development of a Sea Harrier all weather operations capability [AIAA PAPER 81-2407] A82-13892
The Navy F/A-18A Hornet electromagnetic compatibility program A82-14760

AIRCRAFT COMMUNICATION
ARINC 429 digital data communications on the Boeing 757 and 767 commercial airliners [AIAA 81-2267] A82-13485
An update of an integrated CNI system - TIES --- Communication, Navigation, and Identification provided by Tactical Information Exchange System [AIAA 81-2292] A82-13500
On-board communication for active-control transport aircraft [AIAA 81-2321] A82-13520
Future directions in CNI integrated avionics A82-14720

The agile transversal filter - A flexible building block for ICNIA --- Integrated Communications, Navigation and Identification Avionics
A82-14765

AIRCRAFT COMPARTMENTS
A vapour cycle cabin cooling system for the Sea King MK.50 helicopter
[AD-A105211] N82-12069

AIRCRAFT CONFIGURATIONS
The Agusta A129
A82-13237
The F-16/79 test program
[AIAA PAPER 81-2414] A82-13855
Navy performance modeling techniques
[AIAA PAPER 81-2431] A82-13869
The Cessna T303 Crusader
[AIAA PAPER 81-2440] A82-13876
Evaluation of an experimental technique to investigate the effects of the engine position on engine/pylon/wing interference
N82-13090
NASA research in aircraft propulsion
[NASA-TM-82771] N82-13146

AIRCRAFT CONSTRUCTION MATERIALS
Impedance modeling of acoustic absorbing materials for aircraft engine applications
A82-14043

AIRCRAFT CONTROL
Darboux points in minimum-fuel aircraft landing problems
A82-13077
Digital redesign of existing multiloop continuous control systems --- with application to YF-16 aircraft flight controller
A82-13093
Digital control for flexible aircraft using reduced order models
A82-13094
Comparison between the exact and an approximate feedback solution for medium range interception problems
A82-13106
Integrated avionics - Concepts and concerns
[AIAA 81-2211] A82-13452
The interface of multifunction controls and displays to tomorrow's avionics
[AIAA 81-2290] A82-13499
Advanced display systems for crew stations of tactical aircraft
[AIAA 81-2312] A82-13514
Computergraphics for aircraft control
[AIAA 81-2313] A82-13515
Design and flight test of a lateral-directional command augmentation system
[AIAA 81-2331] A82-13527
Flight experience with a remotely augmented vehicle flight test technique
[AIAA PAPER 81-2417] A82-13857
Flight test experience with high-alpha control system techniques on the F-14 airplane
[AIAA PAPER 81-2505] A82-13906
A unique integrated flight testing facility for advanced control/display research
[AIAA PAPER 81-2490] A82-13919
62% manned aircraft demonstrator - Next generation trainer --- cost effective pilot trainer
[AIAA PAPER 81-2519] A82-14385
Electromechanical actuation development program
A82-14705
Will power-by-wire replace power-by-hydraulics
A82-14707
The all electric airplane - Its development and logistic support
A82-14709
Enhanced aircraft handling qualities by longitudinal dynamics mode decoupling
A82-14826
Direct digital design method for reconfigurable multivariable control laws for the A-7D Digitac II aircraft
A82-14828
Design of direct digital flight-mode control systems for high-performance aircraft
A82-14829
Ball-Bartoe Jetwing flight tests
A82-14928
Reliability analysis of the F-8 digital fly-by-wire system
[NASA-CR-163110] N82-12079
Fixed gain controller design for aircraft
[AD-A104877] N82-12081
A standard control display unit for multi-aircraft application
N82-13054

AIRCRAFT DESIGN
The application of large screen CRT's, touch panels, and voice to the flight stations of the 1990's
[AIAA 81-2263] A82-13482
Light-guided information distribution systems
[AIAA 81-2320] A82-13519
Thunderstorm hazards flight research - Program overview
[AIAA PAPER 81-2412] A82-13853
HiMAT aerodynamic design and flight test experience
[AIAA PAPER 81-2433] A82-13871
The Cessna T303 Crusader
[AIAA PAPER 81-2440] A82-13876
Fleet Flight Loads Survey monitoring and analysis techniques
[AIAA PAPER 81-2461] A82-13903
Powered-lift STOL aircraft shipboard operations - A comparison of simulation, land-based and sea trial results for the QSRA --- Quiet Short-haul Research Aircraft
[AIAA PAPER 81-2480] A82-13938
Flight test concept evolation
[AIAA PAPER 81-2375] A82-13944
Trim tab excitation system for the BAe 146
A82-14363
62% manned aircraft demonstrator - Next generation trainer --- cost effective pilot trainer
[AIAA PAPER 81-2519] A82-14385
Hover tests of the XV-15 Tilt Rotor Research Aircraft
[AIAA PAPER 81-2501] A82-14386
The use of frequency methods in rotorcraft system identification
[AIAA PAPER 81-2386] A82-14392
Development of a comprehensive analysis for rotorcraft. II - Aircraft model, solution procedure and applications
A82-14407
Wing design for light transport aircraft with improved fuel economy
A82-14416
New all-electric-system technology --- electromechanical actuators for aircraft
A82-14710
The influence of smart computers on the cockpit of the future
A82-14743
The all composite Lear Fan 2100
A82-14936
Emergency in-flight egress for general aviation aircraft
A82-14953
A new safety harness for mobile aircrew
A82-14963
Crashworthy military passenger seat development
A82-14976
Index of National Aviation Facilities Experimental Center technical reports 1972 - 1977
[AD-A104759] N82-12056
Computational methods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164983] N82-12080
Research and Technology
[NASA-TM-83221] N82-13043
The impact of new guidance and control systems on military aircraft cockpit design
[AGARD-CP-312] N82-13048
Aerodynamics of Power Plant Installation
[AGARD-CP-301] N82-13065
The design and development of the Tornado engine air intake
N82-13074
Evaluation of an experimental technique to investigate the effects of the engine position on engine/pylon/wing interference
N82-13090

AIRCRAFT DETECTION
Inverse SAR and its application to aircraft classification
A82-14871

AIRCRAFT ENGINES
Creep and aero gas turbine design
A82-12987

Direct digital drive actuation
[AIAA 81-2298] A82-13505
Recent propulsion system flight tests at the NASA Dryden Flight Research Center
[AIAA PAPER 81-2438] A82-13874
Flight test method for the determination of reciprocating engine cooling requirements
[AIAA PAPER 81-2446] A82-13878
Aircraft absorbers - Promise and practice --- sound attenuation
A82-14042
Impedance modeling of acoustic absorbing materials for aircraft engine applications
A82-14043
Conceptual design of an integrated power and avionics information system
A82-14788
60 kVA ADP permanent magnet VSCF starter generator system - A program overview --- Variable Speed Constant Frequency
A82-14789
High speed PMG containment study for VSCF system --- Permanent Magnet Generator for Variable Speed Constant Frequency applications
A82-14791
Study of the load-carrying capacity of aviation gas-turbine engine impellers under low-cycle loading at normal and high temperatures
A82-15482
The use of metal finishing in aircraft fuel systems
N82-12077
Aerodynamics of Power Plant Installation
[AGARD-CP-301] N82-13065
Integration of advanced exhaust nozzles
N82-13075
An acquisition and analysis system for dynamic tests of air inlets
N82-13082
Wind tunnel test and analysis techniques using powered simulators for civil nacelle installation drag assessment
N82-13088
Establishment of an experimental technique to provide accurate measurement of the installed drag of close coupled civil nacelle/airframe configurations, using a full span model with turbine powered engine simulators
N82-13089
Evaluation of an experimental technique to investigate the effects of the engine position on engine/pylon/wing interference
N82-13090
Thrust modulation methods for a subsonic V/STOL aircraft
[NASA-TM-82747] N82-13112
A real time Pegasus propulsion system model for VSTOL piloted simulation evaluation
[NASA-TM-82770] N82-13144
Sensor failure detection system --- for the F100 turbofan engine
[NASA-CR-165515] N82-13145

AIRCRAFT EQUIPMENT
The Agusta A129
A82-13237
The development and use of a computer-interactive data acquisition and display system in a flight environment
[AIAA PAPER 81-2371] A82-13946
Fighters - Improving the breed
A82-14354
Pave Mover Flight Test Program
[AIAA PAPER 81-2492] A82-14380
The all electric airplane - Its development and logistic support
A82-14709
New all-electric-system technology --- electromechanical actuators for aircraft
A82-14710
A modular multiplexed digital voice intercommunications system
A82-14721
Computer modeling of an aircraft HVDC electrical system
A82-14819
Digital simulation of aircraft electrical generating system by means of Sceptre program
A82-14820
Computer simulation of an advanced aircraft electrical system
A82-14821
Portable air driven variable speed fiber optic cable termination polisher
[AD-A104797] N82-12448
Practical aspects of instrumentation system installation, volume 13
[NASA-TM-84067] N82-13140

AIRCRAFT FUEL SYSTEMS
The use of metal finishing in aircraft fuel systems
N82-12077

AIRCRAFT FUELS
Darboux points in minimum-fuel aircraft landing problems
A82-13077
Quality optimization and unification of aviation gasolines
A82-15721

AIRCRAFT GUIDANCE
Fuel efficient flight profiles in an ATC flow management environment
A82-13078
Digital detection and processing of laser beacon signals for aircraft collision hazard warning
[AIAA 81-2328] A82-13525
Commentary on facilities used in the development of a Sea Harrier all weather operations capability
[AIAA PAPER 81-2407] A82-13892
Development of an MLS lateral autoland system with automatic path definition
[AIAA PAPER 81-1751] A82-13993

AIRCRAFT HAZARDS
Wire strike protection
A82-13246
Assessment methodology of the lightning threat to advanced aircraft
A82-14759
Operational evaluation of thunderstorm penetration test flights during project Storm Hazards '80
A82-14954
A criterion for determining the causes of wind shear at Punta Raisi Airport, on the basis of statistical data from barograph records
A82-15468
Investigation of severe lightning strike incidents to two USAF F-106A aircraft
[NASA-CR-165794] N82-12052

AIRCRAFT HYDRAULIC SYSTEMS
Will power-by-wire replace power-by-hydraulics
A82-14707
Efficient use of working fluids in aviation hydraulic systems
A82-15724

AIRCRAFT INDUSTRY
Advantages and limitations of various materials used in the construction of modules --- aircraft construction
[SNIAS-812-551-103] N82-12072

AIRCRAFT INSTRUMENTS
Options for GTE precision automated tracking system --- airborne laser tracking system
A82-13020
Helicopter IFR - Past, present and future and future
A82-13245
Electronic flight deck displays for transport aircraft
[AIAA 81-2264] A82-13483
Redundancy management of skewed and dispersed inertial sensors
[AIAA 81-2296] A82-13503
Development and laboratory test of an integrated sensory system /ISS/ for advanced aircraft
[AIAA 81-2297] A82-13504
Flat panel developments for future military aircraft
[AIAA 81-2302] A82-13507
An integrated control panel utilizing a programmable varistor-multiplexed dichroic liquid crystal display
[AIAA 81-2303] A82-13508
Digital avionics display processor
[AIAA 81-2311] A82-13513
A Loran-C prototype navigation receiver for general aviation
[AIAA 81-2329] A82-13532
Georgia Tech coherent jammer flight test
[AIAA PAPER 81-2452] A82-13898

Collection and simulation of spatial infrared signatures of military jet aircraft [AIAA PAPER 81-2494] A82-13921
The Advanced Range Instrumentation Aircraft improvement and modernization program [AIAA PAPER 81-2368] A82-13948
Lockheed Airborne Data System - Distributed microcomputers provide on-board real-time analysis [AIAA PAPER 81-2367] A82-13949
Index of National Aviation Facilities Experimental Center technical reports 1972 - 1977 [AD-A104759] N82-12056
Electronic Master Monitor and Advisory Display System (EMMADS) [AD-A105082] N82-12067

AIRCRAFT LANDING
Darboux points in minimum-fuel aircraft landing problems A82-13077
Joint Tactical Microwave Landing System /JTMLS/ airborne signal processing [AIAA 81-2247] A82-13471
Applications of head-up displays in commercial transport aircraft [AIAA 81-2300] A82-13506
Digital signal processing on a background of rereflections for the international aircraft landing system A82-13703
Comparison of low-speed handling qualities in ground-based and in-flight simulator tests [AIAA PAPER 81-2478] A82-13936
AN/TPN-25 and AN/GPN-22 precision approach radars A82-14856
Flight investigations of integrated descent rate control systems A82-14929
The use of groundspeed, in a wind shear and the flight evaluation of a radar-altimeter-based system for the measurement of groundspeed [AD-A104758] N82-12060
The effect of visual information on manual approach and landing [NLR-MP-80019-U] N82-12064
Limited evaluation of an F-14A airplane utilizing an aileron-rudder interconnect control system in the landing configuration [NASA-TM-81972] N82-13148

AIRCRAFT MAINTENANCE
Fault isolation methodology for the L-1011 digital avionic flight control system [AIAA 81-2223] A82-13458

AIRCRAFT MANEUVERS
Performance estimation from non-steady manoeuvres [AIAA PAPER 81-2424] A82-13863
HiMAT aerodynamic design and flight test experience [AIAA PAPER 81-2433] A82-13871
Application of a microprocessor controlled cockpit display for enhanced pilot control of flight test maneuvers [AIAA PAPER 81-2510] A82-13908
The development of cryogenic wind tunnels and their application to maneuvering aircraft technology A82-13971
Technical/operational ATC scenarios for future TMA navigation A82-14774
Study of the effects of maneuver compensation on beam pointing accuracy A82-14780
The Maneuvering Flight Path Display - A flight trajectory solution display concept A82-14824
Navy spin evaluation of the A-7 airplane configured with automatic maneuvering flaps A82-14933
Large terminal maneuvering areas: Operational problems - Possible development of solutions A82-15625

AIRCRAFT MODELS
Modeling procedures for handling qualities evaluation of flexible aircraft A82-13968
Aeroelasticity matters - Some reflections on two decades of testing in the NASA Langley Transonic Dynamics Tunnel A82-13969
Jet V/STOL wind-tunnel simulation and groundplane effects A82-13973
The use of frequency methods in rotorcraft system identification [AIAA PAPER 81-2386] A82-14392
Development of a comprehensive analysis for rotorcraft. II - Aircraft model, solution procedure and applications A82-14407
A recursive time domain analysis of distributed line grid networks with application to the LTA/EMP problem --- Lightning Threat Analysis A82-14761
Wind tunnel test and analysis techniques using powered simulators for civil nacelle installation drag assessment N82-13088
Establishment of an experimental technique to provide accurate measurement of the installed drag of close coupled civil nacelle/airframe configurations, using a full span model with turbine powered engine simulators N82-13089

AIRCRAFT NOISE
The FAA's proposed helicopter certification rules A82-13242
Costs of noise nuisance from aircraft A82-13314
Aircraft absorbers - Promise and practice --- sound attenuation A82-14042
An advanced facility for processing aircraft dynamic test data [AIAA PAPER 81-2398] A82-14377
Research and Technology [NASA-TM-83221] N82-13043

AIRCRAFT PARTS
In-flight computation of helicopter transmission fatigue life expenditure [AIAA PAPER 81-2434] A82-13872

AIRCRAFT PERFORMANCE
Air-to-air combat analysis - Review of differential-gaming approaches A82-13115
On matching the systems identification technique to the particular application --- in evaluating flight test data A82-13119
An operational model of specific range for microprocessor applications in piston-prop general aviation airplanes [AIAA 81-2330] A82-13526
Real-time flight management avionics software system [AIAA 81-2340] A82-13530
Powered-lift takeoff performance characteristics determined from flight test of the Quiet Short-haul Research Aircraft /QSRA/ [AIAA PAPER 81-2409] A82-13852
The F-16/79 test program [AIAA PAPER 81-2414] A82-13855
A technique to determine lift and drag polars in flight and their application [AIAA PAPER 81-2420] A82-13859
Performance estimation from non-steady manoeuvres [AIAA PAPER 81-2424] A82-13863
Navy performance modeling techniques [AIAA PAPER 81-2431] A82-13869
The Cessna T303 Crusader [AIAA PAPER 81-2440] A82-13876
Information technology and its impact on test and evaluation at the Naval Air Test Center [AIAA PAPER 81-2396] A82-13894
The Air Force Flight Test Center - Utah Test and Training Range in the 1980's [AIAA PAPER 81-2487] A82-13916
Fighters - Improving the breed A82-14354
A review of flight-to-wind tunnel drag correlation [AIAA PAPER 81-2475] A82-14382
62% manned aircraft demonstrator - Next generation trainer --- cost effective pilot trainer [AIAA PAPER 81-2519] A82-14385
AD-1 oblique wing aircraft program [AIAA PAPER 81-2354] A82-14390
Development of a comprehensive analysis for rotorcraft. II - Aircraft model, solution procedure and applications A82-14407

Design of direct digital flight-mode control systems for high-performance aircraft A82-14829
The X-14 - 24 years of V/STOL flight testing A82-14927
Ball-Bartoe Jetwing flight tests A82-14928
F/A-18A high angle of attack/spin testing A82-14934
KC-10 flight test program A82-14935
The all composite Lear Fan 2100 A82-14936
F/A-18 roll rate improvement program A82-14939
AV-8B technical update - Leading edge root extension development A82-14940
Operational evaluation of thunderstorm penetration test flights during project Storm Hazards '80 A82-14954
Airplane performance sensitivities to lateral and vertical profiles A82-15846
Experimental and analytical studies of advanced air cushion landing systems [NASA-CR-3476] N82-12065

AIRCRAFT PILOTS
F/A-18 'Hornet' - One man operability [AIAA 81-2266] A82-13464
The integration of control and display concepts for improved pilot situational awareness A82-13972
Assessing pilot workload - Without disturbing pilot behavior A82-14745

AIRCRAFT PRODUCTION
Aeronautics in China - An AIAA report --- Book A82-13150
A system safety program for aircraft production and deployment A82-14983
The technology of sheet-metal stamping in the production of aircraft /2nd revised and enlarged edition/ --- Russian book A82-14998

AIRCRAFT RELIABILITY
Fault detection for two physically separated, communicating inertial measurement units A82-13142
Wire strike protection A82-13246
Government testing [AIAA PAPER 81-2443] A82-13877
Planning a helicopter flight test program [AIAA PAPER 81-2381] A82-13881
Operational evaluation of the new generation of jet transport aircraft [AIAA PAPER 81-2377] A82-13942
Progress report - CH-47 modernization program A82-14930
Helicopter reliability and maintainability trends during development and production [AD-A105775] N82-13136

AIRCRAFT SAFETY
Fatigue methodology - A technical management system for helicopter safety and durability A82-13240
Fiber-optic immunity to EMI/EMP for military aircraft [AIAA 81-2339] A82-13529
Safety of helicopters in flight --- Russian book A82-14946
U.S. Navy life support development trends A82-14952
A system safety program for aircraft production and deployment A82-14983
An analysis of civil aviation propeller-to-person accidents: 1965-1979 [AD-A105365] N82-12053
Computer Air Carrier Symposium [AD-A104894] N82-12054
Summary of Federal Aviation Administration responses to National Transportation Safety Board safety recommendations [AD-A104922] N82-12055

AIRCRAFT STABILITY
Navigation for helicopters by multiple use of inertial sensors A82-14713
The use of observers on relaxed static stability aircraft A82-14740
F/A-18A high angle of attack/spin testing A82-14934
Acceptance testing of the Calspan variable stability Learjet A82-14937
AV-8B technical update - Leading edge root extension development A82-14940
Direct free-flight analysis of aircraft dynamics at high angles of attack A82-15596

AIRCRAFT STRUCTURES
Fatigue methodology - A technical management system for helicopter safety and durability A82-13240
Flight testing the nonmetallic spline coupling technology at the Naval Air Test Center [AIAA PAPER 81-2405] A82-13891
Flight vibration optimization via conformal mapping A82-13975
Techniques for modifying airfoils and fairings on aircraft using foam and fiberglass [AIAA PAPER 81-2445] A82-14383
The load-carrying behavior of a trapezoidal aluminum-alloy supporting element, subjected to a compressive stress, in the postbuckling region A82-14418
Flight trail of the Aircraft Fatigue Data Analysis System (AFDAS) Mk 2 prototype [AD-A105270] N82-12066
Calculation of wing-body-nacelle interference in subsonic and transonic potential flow N82-13095

AIRCRAFT SURVIVABILITY
Fighters - Improving the breed A82-14354

AIRCRAFT TIRES
Measured pavement response to transient aircraft loadings N82-13442

AIRCRAFT WAKES
Turbulent wake development behind streamlined bodies N82-13104

AIRFOIL PROFILES
Subcritical and supercritical airfoils for given pressure distribution N82-12031
German-Argentine experiment: Vertical-rotor wind engine N82-12648
Wind-tunnel investigation of the effects of blade tip geometry on the interaction of torsional loads and performance for an articulated helicopter rotor [NASA-TP-1926] N82-13107

AIRFOILS
Techniques for modifying airfoils and fairings on aircraft using foam and fiberglass [AIAA PAPER 81-2445] A82-14383
The numerical solution of incompressible turbulent flow over airfoils N82-12030

AIRFRAME MATERIALS
Advantages and limitations of various materials used in the construction of modules --- aircraft construction [SNIAS-812-551-103] N82-12072

AIRFRAMES
The Navy F/A-18A Hornet electromagnetic compatibility program A82-14760
The role and implementation of different nacelle/engine simulation concepts for wind-tunnel testing in research and development work on transport aircraft N82-13086
Establishment of an experimental technique to provide accurate measurement of the installed drag of close coupled civil nacelle/airframe configurations, using a full span model with turbine powered engine simulators N82-13089

Airframe-propulsion system aerodynamic interference predictions at high transonic Mach numbers including off-design engine airflow effects N82-13098

AIRLINE OPERATIONS
Civil aviation in China A82-13600
The payoff from U.S. investment in aeronautical research and development A82-14793
Analysis of integrated fuel-efficient, low-noise procedures in terminal-area operations [DE81-029833] N82-13014

AIRPORT PLANNING
Analysis of integrated fuel-efficient, low-noise procedures in terminal-area operations [DE81-029833] N82-13014

AIRPORTS
Costs of noise nuisance from aircraft A82-13314
A criterion for determining the causes of wind shear at Punta Raisi Airport, on the basis of statistical data from barograph records A82-15468

AIRSPACE
Large terminal maneuvering areas: Operational problems - Possible development of solutions A82-15625

AIRSPEED
AFFTC standard airspeed calibration procedures [AD-A104830] N82-12074

ALGORITHMS
Development of an MLS lateral autoland system with automatic path definition [AIAA PAPER 81-1751] A82-13993

ALKALI HALIDES
Fire extinguishant materials [NASA-CASE-ARC-11252-1] N82-12168

ALKALI METALS
Fire extinguishant materials [NASA-CASE-ARC-11252-1] N82-12168

ALL-WEATHER AIR NAVIGATION
Commentary on facilities used in the development of a Sea Harrier all weather operations capability [AIAA PAPER 81-2407] A82-13892

ALUMINUM ALLOYS
The load-carrying behavior of a trapezoidal aluminum-alloy supporting element, subjected to a compressive stress, in the postbuckling region A82-14418

ALUMINUM COMPOUNDS
The protection of gas turbine blades - A platinum aluminide diffusion coating A82-14364
Fire extinguishant materials [NASA-CASE-ARC-11252-1] N82-12168

ANALOGIES
Calculation of wing-body-nacelle interference in subsonic and transonic potential flow N82-13095

ANALYSIS (MATHEMATICS)
Prediction of aerodynamic loads on aircrafts with external stores at transonic speeds N82-13813

ANGLE OF ATTACK
A large-scale investigation of engine influence on inlet performance at angle-of-attack [AIAA PAPER 81-2481] A82-13939
The USAF Test Pilot School high angle of attack and spin training program A82-14932
F/A-18A high angle of attack/spin testing A82-14934
Direct free-flight analysis of aircraft dynamics at high angles of attack A82-15596
Force and moment, flow-visualization, and boundary-layer tests on a shuttle orbiter model at Mach 6 [NASA-TP-1952] N82-13106
A calculation method for slender wing-body configurations in supersonic flow at high angles of attack --- nonlinear force and pitching moment characteristics [BMVG-FBWT-79-15] N82-13115

ANGULAR VELOCITY
F/A-18 roll rate improvement program A82-14939

ANTENNA ARRAYS
Study of the effects of maneuver compensation on beam pointing accuracy A82-14780

ANTIFRICTION BEARINGS
Optimization of requirements on the pitting-prevention properties of turbojet-engine oils A82-15723

ANTISUBMARINE WARFARE
Light Airborne Multi-Purpose System A82-13244

APPROACH
The use of groundspeed, in a wind shear and the flight evaluation of a radar-altimeter-based system for the measurement of groundspeed [AD-A104758] N82-12060
The effect of visual information on manual approach and landing [NLR-MP-80019-U] N82-12064

APPROACH AND LANDING TESTS (STS)
Analysis of a longitudinal pilot-induced oscillation experienced on the approach and landing test of the space shuttle [NASA-TM-81366] N82-13149

APPROACH CONTROL
Comparison of low-speed handling qualities in ground-based and in-flight simulator tests [AIAA PAPER 81-2478] A82-13936
Development of an MLS lateral autoland system with automatic path definition [AIAA PAPER 81-1751] A82-13993

APPROACH INDICATORS
Experimental evaluation of a perspective tunnel display for three-dimensional helicopter approaches A82-15847

APPROXIMATION
Structural dynamics: Modified calculations --- natural and harmonically excited vibrations of modified structures; increased computation efficiency [BMVG-FBWT-81-1] N82-13457

ARCHITECTURE (COMPUTERS)
An advanced programmable/reconfigurable color graphics display system for crew station technology research [AIAA 81-2314] A82-13516
Advanced weapon systems - Integration technology --- Digital Avionic Information System [AIAA 81-2213] A82-13533
Advanced integrated CNI architectures --- Communications, Navigation and Identification avionics for tactical aircraft and attack helicopter A82-14763

ARGENTINA
German-Argentine experiment: Vertical-rotor wind engine N82-12646

ATMOSPHERIC EFFECTS
Updated station deselection procedures to support automatic Omega receiver operation A82-14712

ATMOSPHERIC ELECTRICITY
Direct strike lightning measurement system --- for aircraft [AIAA PAPER 81-2513] A82-13910

ATMOSPHERIC PRESSURE
A criterion for determining the causes of wind shear at Punta Raisi Airport, on the basis of statistical data from barograph records A82-15468

ATMOSPHERIC SCATTERING
Commercial airborne weather radar technology A82-14668

ATTACK AIRCRAFT
Air-to-air combat analysis - Review of differential-gaming approaches A82-13115
The TADS/PNVS 'eyes' for the AH-64 attack helicopter A82-13239
Test and evaluation of improved aircrew restraint systems A82-14974
Using voice control onboard combat aircraft N82-13056

A new approach to modeling the cost of ownership for aircraft systems [AD-A104434] N82-13979

ATTITUDE STABILITY
- Selected stability and control derivatives from the first Space Shuttle entry [AIAA PAPER 81-2451] A82-13880

AUTOMATIC CONTROL
- Technical/operational ATC scenarios for future TMA navigation A82-14774
- Automatic parachute releasers for premeditated parachuting A82-14960
- Further test results of parachutes with automatic inflation modulation /A.I.M./ A82-14965
- Sensor failure detection system --- for the F100 turbofan engine [NASA-CR-165515] N82-13145

AUTOMATIC FLIGHT CONTROL
- Digital redesign of existing multiloop continuous control systems --- with application to YF-16 aircraft flight controller A82-13093
- Digital control for flexible aircraft using reduced order models A82-13094
- F/A-18A weapon system - 1976 state of the art [AIAA 81-2215] A82-13453
- Application of the concept of dynamic trim control and nonlinear system inverses to automatic control of a vertical attitude takeoff and landing aircraft [AIAA 81-2238] A82-13466
- Have we overlooked the pilot's role in an automated flight deck [AIAA 81-2262] A82-13481
- Direct digital drive actuation [AIAA 81-2298] A82-13505
- Higher order Information Transfer Systems are coming [AIAA 81-2317] A82-13517
- Electromechanical actuation development program A82-14705
- Integrated Flight/Weapon Control design and evaluation A82-14741
- Parallel processing applied to digital flight control systems - Some perspectives A82-14794
- Microprocessor flight control application study A82-14796
- A synthesis technique for highly uncertain and interacting multivariable flight control systems A82-14827

AUTOMATIC GAIN CONTROL
- Automatic digital gain ranging --- for flight test telemetry data [AIAA PAPER 81-2370] A82-13947

AUTOMATIC LANDING CONTROL
- Joint Tactical Microwave Landing System /JTMLS/ airborne signal processing [AIAA 81-2247] A82-13471
- Applications of head-up displays in commercial transport aircraft [AIAA 81-2300] A82-13506
- Development of an MLS lateral autoland system with automatic path definition [AIAA PAPER 81-1751] A82-13993
- AN/TPN-25 and AN/GPN-22 precision approach radars A82-14856
- Flight investigations of integrated descent rate control systems A82-14929

AUTOMATIC PILOTS
- The design of exact nonlinear model followers --- with application to trajectory autopilot for helicopter A82-13125

AUTOMATIC TEST EQUIPMENT
- Information technology and its impact on test and evaluation at the Naval Air Test Center [AIAA PAPER 81-2396] A82-13894
- Vibration test procedures for accessory angle drive gearboxes on Atar 09C engines --- turbojet engines [AD-A105269] N82-12076

AVIONICS
- Options for GTE precision automated tracking system --- airborne laser tracking system A82-13020
- The Agusta A129 A82-13237
- Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers A82-13451
- Integrated avionics - Concepts and concerns [AIAA 81-2211] A82-13452
- F/A-18A weapon system - 1976 state of the art [AIAA 81-2215] A82-13453
- Digital avionics - What a pilot expects to see [AIAA 81-2217] A82-13455
- Applications of digital avionics to commercial transport aircraft - The DC-9 Super 80 and beyond [AIAA 81-2218] A82-13456
- The role of avionics in the all electric airplane [AIAA 81-2219] A82-13457
- Fault isolation methodology for the L-1011 digital avionic flight control system [AIAA 81-2223] A82-13458
- Avionics implications from weapon system operational utility studies on Manned Air Combat Simulators [AIAA 81-2230] A82-13463
- Aircraft separation assurance avionics [AIAA 81-2239] A82-13467
- Aircraft alerting systems standardization study [AIAA 81-2242] A82-13468
- LHX - An advanced avionics system design [AIAA 81-2249] A82-13472
- F/A-18 'Hornet' - One man operability [AIAA 81-2266] A82-13484
- ARINC 429 digital data communications on the Boeing 757 and 767 commercial airliners [AIAA 81-2267] A82-13485
- A polled contention multiplex system using MIL-STD-1553 protocol [AIAA 81-2271] A82-13487
- Avionics systems simulation for the Northrop F/A-18L aircraft [AIAA 81-2274] A82-13488
- The electronic terrain map - A new avionics integrator [AIAA 81-2289] A82-13498
- The interface of multifunction controls and displays to tomorrow's avionics [AIAA 81-2290] A82-13499
- Development and laboratory test of an integrated sensory system /ISS/ for advanced aircraft [AIAA 81-2297] A82-13504
- An integrated control panel utilizing a programmable varistor-multiplexed dichroic liquid crystal display [AIAA 81-2303] A82-13508
- Digital avionics display processor [AIAA 81-2311] A82-13513
- An advanced programmable/reconfigurable color graphics display system for crew station technology research [AIAA 81-2314] A82-13516
- Advanced fiber optic systems for avionics applications [AIAA 81-2319] A82-13518
- Light-guided information distribution systems [AIAA 81-2320] A82-13519
- On-board communication for active-control transport aircraft [AIAA 81-2321] A82-13520
- Real-time flight management avionics software system [AIAA 81-2340] A82-13530
- Time-referencing of data in an asynchronous environment --- for fighter aircraft avionics [AIAA 81-2341] A82-13531
- A Loran-C prototype navigation receiver for general aviation [AIAA 81-2329] A82-13532
- Advanced weapon systems - Integration technology --- Digital Avionic Information System [AIAA 81-2213] A82-13533
- Estimation of the efficiency of radioelectronic flight navigation systems A82-13701
- Georgia Tech coherent jammer flight test [AIAA PAPER 81-2452] A82-13898

F-4 Advanced Avionics Flight Test [AIAA PAPER 81-2464] A82-13929
The Advanced Range Instrumentation Aircraft improvement and modernization program [AIAA PAPER 81-2360] A82-13948
NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volumes 1, 2 & 3 A82-14676
Navigation for helicopters by multiple use of inertial sensors A82-14713
Future directions in CNI integrated avionics A82-14720
A modular multiplexed digital voice intercommunications system A82-14721
The influence of smart computers on the cockpit of the future A82-14743
Assessment methodology of the lightning threat to advanced aircraft A82-14759
New advances in signal processing technology for integrated CNI avionics --- Communication, Navigation, and Identification A82-14762
Advanced integrated CNI architectures --- Communications, Navigation and Identification avionics for tactical aircraft and attack helicopter A82-14763
The agile transversal filter - A flexible building block for ICNIA --- Integrated Communications, Navigation and Identification Avionics A82-14765
Applications of covariance analysis simulation to avionics flight testing A82-14767
Conceptual design of an integrated power and avionics information system A82-14788
Implementing the DAIS executive --- Digital Avionics Information System software feasibility for aircraft systems A82-14814
A storage device for subsystem maintenance information A82-14817
Air-to-ground MTI radar using a displaced phase center, phased array A82-14881
Portable air driven variable speed fiber optic cable termination polisher [AD-A104797] N82-12448
The impact of new guidance and control systems on military aircraft cockpit design [AGARD-CP-312] N82-13048
How the helicopter cockpit designer uses digital avionics N82-13049
Electronic flight deck displays for military transport aircraft N82-13050
Integration of controls and displays in US Army helicopter cockpits N82-13053
A standard control display unit for multi-aircraft application N82-13054
Tanker avionics and aircrew complement evaluation N82-13063
Techniques for interfacing multiplex systems [AD-A101457] N82-13135
Electronic master monitor and advisory display system test and demonstration report [AD-A105317] N82-13141
AXES OF ROTATION
German-Argentine experiment: Vertical-rotor wind engine N82-12648
AXIAL FLOW TURBINES
An aerodynamic design and the overall stage performance of an air-cooled axial-flow turbine [NAL-TR-321T] N82-13109
AXISYMMETRIC FLOW
Investigation of acoustic interactions in jet thrust augmenting ejectors [AD-A106083] N82-13835

B

B-1 AIRCRAFT
Comparison of wind tunnel and theoretical aeroelastic predictions with flight measured airloads for the B-1 aircraft [AIAA PAPER 81-2387] A82-14393
B-52 AIRCRAFT
Applications of covariance analysis simulation to avionics flight testing A82-14767
BACKSCATTERING
Commercial airborne weather radar technology A82-14868
BALLISTICS
A ballistic design model for initiators for aircraft personnel escape systems A82-14984
BEACONS
Digital detection and processing of laser beacon signals for aircraft collision hazard warning [AIAA 81-2328] A82-13525
BIBLIOGRAPHIES
Index of National Aviation Facilities Experimental Center technical reports 1972 - 1977 [AD-A104759] N82-12056
Compilation of abstracts of dissertations theses, and research papers submitted by candidates for degrees, 1 October 1979 - 30 September 1980 [AD-A104124] N82-13974
BLADE TIPS
Experimental and analytical studies of a model helicopter rotor in hover [NASA-TM-81232] N82-12042
Wind-tunnel investigation of the effects of blade tip geometry on the interaction of torsional loads and performance for an articulated helicopter rotor [NASA-TP-1926] N82-13107
BODY SIZE (BIOLOGY)
'Little people' problem /MA-2 torso harness/ A82-14958
BODY-WING CONFIGURATIONS
The influence of closed-coupled, rear fuselage mounted nacelles on the design of an advanced high speed wing N82-13092
A calculation method for slender wing-body configurations in supersonic flow at high angles of attack --- nonlinear force and pitching moment characteristics [BMVG-FBWT-79-15] N82-13115
BOEING AIRCRAFT
Two at a time - Flight test plans for the new Boeing airliners [AIAA PAPER 81-2378] A82-13941
Design of a crashworthy crew seat for the Boeing Vertol Chinook helicopter A82-14975
BOEING 757 AIRCRAFT
ARINC 429 digital data communications on the Boeing 757 and 767 commercial airliners [AIAA 81-2267] A82-13485
BOEING 767 AIRCRAFT
ARINC 429 digital data communications on the Boeing 757 and 767 commercial airliners [AIAA 81-2267] A82-13485
BOUNDARY LAYER FLOW
Force and moment, flow-visualization, and boundary-layer tests on a shuttle orbiter model at Mach 6 [NASA-TP-1952] N82-13106
BRAKES (FOR ARRESTING MOTION)
Escape systems decelerator technology [AIAA PAPER 81-1913] A82-13966
BYPASS RATIO
The role and implementation of different nacelle/engine simulation concepts for wind-tunnel testing in research and development work on transport aircraft N82-13086
Aerodynamic aspects of a high bypass ratio engine installation on a fuselage afterbody N82-13093

C

C-5 AIRCRAFT
C-5A unsurfaced taxi and off-load demonstrations [AIAA PAPER 81-2439] A82-13875

CALIBRATING
Rotor systems research aircraft /RSRA/ rotor force and moment measurement system [AIAA PAPER 81-2516] A82-13913
Improved techniques for the calibration and measurement of in-flight loads [AIAA PAPER 81-2502] A82-13924
AFFTC standard airspeed calibration procedures [AD-A104830] N82-12074
Wind tunnel test and analysis techniques using powered simulators for civil nacelle installation drag assessment N82-13088
Practical aspects of instrumentation system installation, volume 13 [NASA-TM-84067] N82-13140

CAMERAS
Current aerial cameras A82-15655

CANOPIES
Further test results of parachutes with automatic inflation modulation /A.I.M./ A82-14965
A look at the Hoffman Triangular parachute - The first successful glidable parachute A82-14966

CARGO AIRCRAFT
KC-10 flight test program A82-14935

CARTRIDGES
Analytical and experimental characterization of the JAU-14/A cartridge actuated initiator for use in aircrew escape system performance evaluation A82-14985

CASCADE CONTROL
Digital redesign of existing multiloop continuous control systems --- with application to YF-16 aircraft flight controller A82-13093

CATALYSTS
Development of catalytic systems for the conversion of syngas to jet fuel and diesel fuel and higher alcohols [DE82-000067] N82-12255

CATHODE RAY TUBES
The application of large screen CRT's, touch panels, and voice to the flight stations of the 1990's [AIAA 81-2263] A82-13482
Electronic flight deck displays for transport aircraft [AIAA 81-2264] A82-13483
Airborne color CRT displays A82-14823
Electronic flight deck displays for military transport aircraft N82-13050
Color CRT displays for the cockpit N82-13051

CENTRIFUGAL COMPRESSORS
CT7 - GE attacks commuter turboprop market A82-15950

CERTIFICATION
The FAA's proposed helicopter certification rules A82-13242
The F-16/79 test program [AIAA PAPER 81-2414] A82-13855
Simulator certification methods and the vertical motion simulator [NASA-CR-166252] N82-12082

CESSNA AIRCRAFT
The Cessna T303 Crusader [AIAA PAPER 81-2440] A82-13876

CH-47 HELICOPTER
Progress report - CH-47 modernization program A82-14930
Design of a crashworthy crew seat for the Boeing Vertol Chinook helicopter A82-14975

CHANNELS (DATA TRANSMISSION)
A polled contention multiplex system using MIL-STD-1553 protocol [AIAA 81-2271] A82-13487
Advanced fiber optic systems for avionics applications [AIAA 81-2319] A82-13518
A modular multiplexed digital voice intercommunications system A82-14721
Techniques for interfacing multiplex systems [AD-A101457] N82-13135

CHEMICAL ATTACK
Attack on superalloys by chemical and electrolytic processes A82-14365

CHEMICAL COMPOSITION
Efficient use of working fluids in aviation hydraulic systems A82-15724

CHINESE PEOPLES REPUBLIC
Aeronautics in China - An AIAA report --- Book A82-13150

CHIPS (ELECTRONICS)
A storage device for subsystem maintenance information A82-14817

CIRCULAR CYLINDERS
Effects of intake geometry on circular pitot intake performance at zero and low forward speeds N82-13070

CIVIL AVIATION
Public service helicopters - Is the grass greener on the other side of the fence A82-13238
Civil aviation in China A82-13600
Progress in aeronautical research and technology applicable to civil air transports A82-13974
Computer Air Carrier Symposium [AD-A104894] N82-12054
Summary of Federal Aviation Administration responses to National Transportation Safety Board safety recommendations [AD-A104922] N82-12055
Group 1: Scenario design and development issues N82-13131

CLASSIFICATIONS
Inverse SAR and its application to aircraft classification A82-14871

CLOCKS
Electronic master monitor and advisory display system test and demonstration report [AD-A105317] N82-13141

COCKPITS
Have we overlooked the pilot's role in an automated flight deck [AIAA 81-2262] A82-13481
The application of large screen CRT's, touch panels, and voice to the flight stations of the 1990's [AIAA 81-2263] A82-13482
F/A-18 'Hornet' - One man operability [AIAA 81-2266] A82-13484
Application of a microprocessor controlled cockpit display for enhanced pilot control of flight test maneuvers [AIAA PAPER 81-2510] A82-13908
The influence of smart computers on the cockpit of the future A82-14743
Airborne color CRT displays A82-14823
The impact of new guidance and control systems on military aircraft cockpit design [AGARD-CP-312] N82-13048
How the helicopter cockpit designer uses digital avionics N82-13049
Electronic flight deck displays for military transport aircraft N82-13050
Color CRT displays for the cockpit N82-13051
Integration of controls and displays in US Army helicopter cockpits N82-13053

F/A 18 Hornet crew station
N82-13064
COLLAPSE
Theoretical analysis of wake-induced parachute collapse
[AIAA PAPER 81-1922] A82-13963
COLLIMATION
Head up displays
N82-13052
COLLISION AVOIDANCE
Aircraft separation assurance avionics
[AIAA 81-2239] A82-13467
Digital detection and processing of laser beacon signals for aircraft collision hazard warning
[AIAA 81-2328] A82-13525
COLOR VISION
Airborne color CRT displays
A82-14823
COMBAT
Air-to-air combat analysis - Review of differential-gaming approaches
A82-13115
Use of a helmet-mounted matrix display for presenting energy-maneuverability information during simulated close combat
N82-13061
COMBUSTION CHAMBERS
Experimental investigation of total pressure loss and airflow distribution for gas turbine combustors
A82-15606
COMBUSTION PRODUCTS
Chemistry of combustion of fuel-water mixtures
[AD-A105401] N82-12178
COMMAND AND CONTROL
Computergraphics for aircraft control
[AIAA 81-2313] A82-13515
Using voice control onboard combat aircraft
N82-13056
COMMAND GUIDANCE
A polled contention multiplex system using MIL-STD-1553 protocol
[AIAA 81-2271] A82-13487
Design and flight test of a lateral-directional command augmentation system
[AIAA 81-2331] A82-13527
COMMERCIAL AIRCRAFT
Applications of digital avionics to commercial transport aircraft - The DC-9 Super 80 and beyond
[AIAA 81-2218] A82-13456
Applications of head-up displays in commercial transport aircraft
[AIAA 81-2300] A82-13506
CT7 - GE attacks commuter turboprop market
A82-15950
Application of singular perturbation theory
N82-12050
In-service inspection methods for graphite-epoxy structures on commercial transport aircraft
[NASA-CR-165746] N82-12142
COMMUNICATION CABLES
Fiber-optic immunity to EMI/EMP for military aircraft
[AIAA 81-2339] A82-13529
COMMUNICATION EQUIPMENT
Light-guided information distribution systems
[AIAA 81-2320] A82-13519
Portable air driven variable speed fiber optic cable termination polisher
[AD-A104797] N82-12448
COMMUNICATION NETWORKS
Using phased array radar for data communications
A82-14725
COMMUNICATION THEORY
Distributed Time Division Multiple Access /DTDMA/ - A distributed signaling technique for advanced tactical communications
A82-14719
COMPONENT RELIABILITY
Practical aspects of instrumentation system installation, volume 13
[NASA-TM-84067] N82-13140
COMPOSITE MATERIALS
Investigation of the structural degradation and personnel hazards resulting from helicopter composite structures exposed to fires and/or explosions
[AD-A104757] N82-12057
Effect of fighter attack spectrum on composite fatigue life
[AD-A105034] N82-12143
Research and Technology
[NASA-TM-83221] N82-13043
COMPOSITE STRUCTURES
A set of finite elements developed for the dynamic computation of composite helicopter blades
[ONERA, TP NO. 1981-87] A82-13990
The all composite Lear Fan 2100
A82-14936
COMPRESSION LOADS
The load-carrying behavior of a trapezoidal aluminum-alloy supporting element, subjected to a compressive stress, in the postbuckling region
A82-14418
Measured pavement response to transient aircraft loadings
N82-13442
COMPRESSOR EFFICIENCY
Compressor stall inducing installation effects of an engine control parameter for the CF-5 aircraft
N82-13085
COMPUTATIONAL FLUID DYNAMICS
Overview of flight and ground testing with emphasis on the wind tunnel
[AIAA PAPER 81-2474] A82-13928
The operational characteristics of turbojets, giving particular attention to the cooled high-pressure turbine
A82-14414
Rapid elliptic solvers
A82-15827
Remarks on the calculation of transonic potential flow by a finite volume method
A82-15835
Prediction and measurement of time-variant, three-dimensional flows in military aircraft intakes
N82-13069
COMPUTER DESIGN
The SIFT computer and its development --- Software Implemented Fault Tolerance for aircraft control
[AIAA 81-2278] A82-13490
COMPUTER GRAPHICS
The electronic terrain map - A new avionics integrator
[AIAA 81-2289] A82-13498
Computergraphics for aircraft control
[AIAA 81-2313] A82-13515
An advanced programmable/reconfigurable color graphics display system for crew station technology research
[AIAA 81-2314] A82-13516
Software considerations in the design of computer generated flight displays
A82-14742
Airborne Electronic Map Systems. I - Design
A82-14770
Computer image generation for flight simulation
A82-15599
Experimental evaluation of a perspective tunnel display for three-dimensional helicopter approaches
A82-15847
COMPUTER NETWORKS
Low cost programmable multisimulator facility
[AIAA 81-2229] A82-13534
COMPUTER PROGRAMMING
Mathematical programming in engineering design problems
A82-15864
COMPUTER PROGRAMS
The SIFT computer and its development --- Software Implemented Fault Tolerance for aircraft control
[AIAA 81-2278] A82-13490
Navy performance modeling techniques
[AIAA PAPER 81-2431] A82-13869
The need for, and development of, a simulation facility at the Naval Air Test Center
[AIAA PAPER 81-2488] A82-13917
The design and implementation of a canned scenario function for the F-16 dynamic system simulator
A82-14678
Weather impact on low-altitude imaging infrared sensors in Europe - An availability model
A82-14779

Digital simulation of aircraft electrical generating system by means of Sceptre program
A82-14820
Investigation of the structural degradation and personnel hazards resulting from helicopter composite structures exposed to fires and/or explosions
[AD-A104757] N82-12057
Subsonic military aircraft engine intake: An integrated theoretical experiment design
N82-13073
Numerical analysis of the scramjet-inlet flow field by using two-dimensional Navier-Stokes equations
[NASA-TP-1940] N82-13142

COMPUTER STORAGE DEVICES
A storage device for subsystem maintenance information
A82-14817

COMPUTER SYSTEMS DESIGN
Information technology and its impact on test and evaluation at the Naval Air Test Center
[AIAA PAPER 81-2396] A82-13894
The need for, and development of, a simulation facility at the Naval Air Test Center
[AIAA PAPER 81-2488] A82-13917
Two at a time - Flight test plans for the new Boeing airliners
[AIAA PAPER 81-2378] A82-13941
The design and implementation of a canned scenario function for the F-16 dynamic system simulator
A82-14678

COMPUTER SYSTEMS PROGRAMS
An advanced programmable/reconfigurable color graphics display system for crew station technology research
[AIAA 81-2314] A82-13516
Real-time flight management avionics software system
[AIAA 81-2340] A82-13530
Software considerations in the design of computer generated flight displays
A82-14742
Implementing the DAIS executive --- Digital Avionics Information System software feasibility for aircraft systems
A82-14814
General purpose real-time interaction panel for digital simulation --- of flight control systems
A82-14831

COMPUTER TECHNIQUES
The Maneuvering Flight Path Display - A flight trajectory solution display concept
A82-14824
Computer-animated predictive displays for microwave landing approaches
A82-15816
Compilation of abstracts of dissertations theses, and research papers submitted by candidates for degrees, 1 October 1979 - 30 September 1980
[AD-A104124] N82-13974

COMPUTERIZED DESIGN
Digital redesign of existing multiloop continuous control systems --- with application to YF-16 aircraft flight controller
A82-13093
High voltage/high power for airborne applications
A82-15918
Subcritical and supercritical airfoils for given pressure distribution
N82-12031

COMPUTERIZED SIMULATION
Low cost programmable multisimulator facility
[AIAA 81-2229] A82-13534
Navy performance modeling techniques
[AIAA PAPER 81-2431] A82-13869
The need for, and development of, a simulation facility at the Naval Air Test Center
[AIAA PAPER 81-2488] A82-13917
Strapdown inertial reference systems performance analysis
A82-14682
A methodology for missile launch envelope display evaluation
A82-14744
Computer modeling of an aircraft HVDC electrical system
A82-14819
Computer simulation of an advanced aircraft electrical system
A82-14821
A synthesis technique for highly uncertain and interacting multivariable flight control systems
A82-14827
Performance assessment of the ACES-II ejection seat-A-10 configuration
A82-14980
Subsonic military aircraft engine intake: An integrated theoretical experiment design
N82-13073

CONFERENCES
Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers
A82-13451
NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volumes 1, 2 & 3
A82-14676
The impact of new guidance and control systems on military aircraft cockpit design
[AGARD-CP-312] N82-13048

CONFORMAL MAPPING
Flight vibration optimization via conformal mapping
A82-13975

CONICAL NOZZLES
The subsonic performance of practical military variable area convergent nozzles
N82-13076

CONTROL BOARDS
Flat panel developments for future military aircraft
[AIAA 81-2302] A82-13507
An integrated control panel utilizing a programmable varistor-multiplexed dichroic liquid crystal display
[AIAA 81-2303] A82-13508
Tanker avionics and aircrew complement evaluation
N82-13063
F/A 18 Hornet crew station
N82-13064

CONTROL CONFIGURED VEHICLES
Direct digital design method for reconfigurable multivariable control laws for the A-7D Digitac II aircraft
A82-14828

CONTROL EQUIPMENT
The interface of multifunction controls and displays to tomorrow's avionics
[AIAA 81-2290] A82-13499
The use of separated multifunction inertial sensors for flight control
[AIAA 81-2295] A82-13502
The integration of control and display concepts for improved pilot situational awareness
A82-13972
The impact of new guidance and control systems on military aircraft cockpit design
[AGARD-CP-312] N82-13048
Integration of controls and displays in US Army helicopter cockpits
N82-13053
A standard control display unit for multi-aircraft application
N82-13054
Sensor failure detection system --- for the F100 turbofan engine
[NASA-CR-165515] N82-13145

CONTROL SIMULATION
An approach to robust nonlinear control design --- with illustration of J-85 turbojet engine simulation
A82-13128
Avionics systems simulation for the Northrop F/A-18L aircraft
[AIAA 81-2274] A82-13488
Modeling procedures for handling qualities evaluation of flexible aircraft
A82-13968

CONTROL STABILITY
The use of observers on relaxed static stability aircraft
A82-14740

CONTROL SURFACES
Direct digital design method for reconfigurable multivariable control laws for the A-7D Digitac II aircraft
A82-14828

Force and moment, flow-visualization, and boundary-layer tests on a shuttle orbiter model at Mach 6
[NASA-TP-1952] N82-13106
Pressure distributions on three different cruciform aft-tail control surfaces of a wingless missile at Mach 1.60, 2.36, and 3.70. Volume 1: Trapezoidal tail
[NASA-TM-80097] N82-13110

CONTROL THEORY
Robust flight control - A design example
A82-15845
Computational methods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164983] N82-12080
Fixed gain controller design for aircraft
[AD-A104877] N82-12081

CONTROLLABILITY
Flight test experience with high-alpha control system techniques on the F-14 airplane
[AIAA PAPER 81-2505] A82-13906
Comparison of low-speed handling qualities in ground-based and in-flight simulator tests
[AIAA PAPER 81-2478] A82-13936
Modeling procedures for handling qualities evaluation of flexible aircraft
A82-13968
In-flight deflection measurement of the HiMAT aeroelastically tailored wing
[AIAA PAPER 81-2450] A82-14381
Enhanced aircraft handling qualities by longitudinal dynamics mode decoupling
A82-14826
Limited evaluation of an F-14A airplane utilizing an aileron-rudder interconnect control system in the landing configuration
[NASA-TM-81972] N82-13148

CONTROLLERS
Computational methods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164983] N82-12080

CONVERGENT NOZZLES
Performance assessment of an advanced reheated turbo fan engine
[AIAA PAPER 81-2447] A82-13879
The subsonic performance of practical military variable area convergent nozzles
N82-13076
Comparison of different nozzle concepts for a reheated turbofan
N82-13077
Investigation of acoustic interactions in jet thrust augmenting ejectors
[AD-A106083] N82-13835

CONVERGENT-DIVERGENT NOZZLES
Comparison of different nozzle concepts for a reheated turbofan
N82-13077

COOLING SYSTEMS
Flight test method for the determination of reciprocating engine cooling requirements
[AIAA PAPER 81-2446] A82-13878
A vapour cycle cabin cooling system for the Sea King MK.50 helicopter
[AD-A105211] N82-12069

CORROSION PREVENTION
The protection of gas turbine blades - A platinum aluminide diffusion coating
A82-14364
Attack on superalloys by chemical and electrolytic processes
A82-14365

COST ANALYSIS
Costs of noise nuisance from aircraft
A82-13314

COST EFFECTIVENESS
A cost effective method for the control of roll due to side slip on a low speed aircraft
[AIAA PAPER 81-2422] A82-13861

COST ESTIMATES
A new approach to modeling the cost of ownership for aircraft systems
[AD-A104434] N82-13979

COUPLED MODES
Enhanced aircraft handling qualities by longitudinal dynamics mode decoupling
A82-14826

COUPLING
Effects of aerodynamic coupling on the dynamics of roll aircraft
N82-12070

COUPLINGS
Flight testing the nonmetallic spline coupling technology at the Naval Air Test Center
[AIAA PAPER 81-2405] A82-13891

COVARIANCE
Applications of covariance analysis simulation to avionics flight testing
A82-14767

CRACK PROPAGATION
Study of the load-carrying capacity of aviation gas-turbine engine impellers under low-cycle loading at normal and high temperatures
A82-15482

CRASHES
Design of a crashworthy crew seat for the Boeing Vertol Chinook helicopter
A82-14975
Crashworthy military passenger seat development
A82-14976
NASEP - Survival from crashed Navy helicopters
A82-14977

CREEP RUPTURE STRENGTH
Creep and aero gas turbine design
A82-12987

CREW STATIONS
An advanced programmable/reconfigurable color graphics display system for crew station technology research
[AIAA 81-2314] A82-13516

CROSS COUPLING
Evaluation and wind tunnel tests of the 4,000 lb (normal-force) pitch/yaw and roll dynamic stability balance systems for measuring direct, cross, and cross-coupling derivatives
[AD-A105122] N82-12047

CRYOGENIC WIND TUNNELS
The development of cryogenic wind tunnels and their application to maneuvering aircraft technology
A82-13971

CYCLIC LOADS
Study of the load-carrying capacity of aviation gas-turbine engine impellers under low-cycle loading at normal and high temperatures
A82-15482

D

DAMAGE ASSESSMENT
Investigation of severe lightning strike incidents to two USAF F-106A aircraft
[NASA-CR-165794] N82-12052

DAMPING
Experimental and analytical studies of advanced air cushion landing systems
[NASA-CR-3476] N82-12065

DATA ACQUISITION
The development and use of a computer-interactive data acquisition and display system in a flight environment
[AIAA PAPER 81-2371] A82-13946
AFFTC standard airspeed calibration procedures
[AD-A104830] N82-12074
An acquisition and analysis system for dynamic tests of air inlets
N82-13082

DATA BASES
Aircraft alerting systems standardization study
[AIAA 81-2282] A82-13460

DATA COMPRESSION
Automatic digital gain ranging --- for flight test telemetry data
[AIAA PAPER 81-2370] A82-13947

DATA LINKS
Distributed Time Division Multiple Access /DTDMA/ - A distributed signaling technique for advanced tactical communications
A82-14719

DATA MANAGEMENT
Two at a time - Flight test plans for the new Boeing airliners
[AIAA PAPER 81-2379] A82-13941
Algorithms for an adaptive dynamic window in electronic map systems
A82-14769

DATA PROCESSING
Digital avionics display processor
[AIAA 81-2311] A82-13513
Time-referencing of data in an asynchronous environment --- for fighter aircraft avionics
[AIAA 81-2341] A82-13531
Recent improvements at the Naval Air Test Center for increased test system flexibility
[AIAA PAPER 81-2392] A82-13888
Fleet Flight Loads Survey monitoring and analysis techniques
[AIAA PAPER 81-2461] A82-13903
The Advanced Range Instrumentation Aircraft improvement and modernization program
[AIAA PAPER 81-2368] A82-13948
Status and tracking system for flight test data products
[AIAA PAPER 81-2395] A82-14376
Integrated flight testing based on nonlinear system identification data processing techniques
[AIAA PAPER 81-2449] A82-14389
A multimicroprocessor system for ATCRBS monopulse data processing
A82-14777
DATA RECORDERS
Extended time radar raw video recording
A82-14909
DATA REDUCTION
On matching the systems identification technique to the particular application --- in evaluating flight test data
A82-13119
DATA STORAGE
A storage device for subsystem maintenance information
A82-14817
DATA SYSTEMS
Development and laboratory test of an integrated sensory system /ISS/ for advanced aircraft
[AIAA 81-2297] A82-13504
Advanced fiber optic systems for avionics applications
[AIAA 81-2319] A82-13518
A technique to determine lift and drag polars in flight and their application
[AIAA PAPER 81-2420] A82-13859
An advanced facility for processing aircraft dynamic test data
[AIAA PAPER 81-2398] A82-14377
DATA TRANSMISSION
ARINC 429 digital data communications on the Boeing 757 and 767 commercial airliners
[AIAA 81-2267] A82-13485
Higher order Information Transfer Systems are coming
[AIAA 81-2317] A82-13517
Light-guided information distribution systems
[AIAA 81-2320] A82-13519
High speed microwave phase-locked loops
A82-14696
Using phased array radar for data communications
A82-14725
Columbus, Ohio, Voice response system demonstration and evaluation
[AD-A104750] N82-12304
DC 9 AIRCRAFT
Applications of digital avionics to commercial transport aircraft - The DC-9 Super 80 and beyond
[AIAA 81-2218] A82-13456
DC 10 AIRCRAFT
KC-10, flight test program management - The contractor's viewpoint
[AIAA PAPER 81-2380] A82-14384
DE HAVILLAND AIRCRAFT
Flight testing De Havilland Aircraft Limited DASH-8 utilizing onboard data analysis by microprocessor
[AIAA PAPER 81-2507] A82-13907
DECELERATION
Escape systems decelerator technology
[AIAA PAPER 81-1913] A82-13966
DECOUPLING
A decoupled control system for improved flight performance in wind shear
A82-13079
DEFLECTION
Measured pavement response to transient aircraft loadings
N82-13442
DEFLECTORS
Transonic flows in an air inlet with large incidence and the effect of a blowing trap
N82-13071
DEFORMATION
Measured pavement response to transient aircraft loadings
N82-13442
DEGREES OF FREEDOM
Analysis of escape systems at 687 KEAS
A82-14578
DENSITY MEASUREMENT
Formulation and characterization of polyimide resilient foams of various densities for aircraft seating applications
[NASA-CR-167421] N82-12230
DEPOSITS
Determination and analysis of jet and missile fuel deposits
[AD-A105458] N82-12248
DESCENT TRAJECTORIES
Flight investigations of integrated descent rate control systems
A82-14929
DESCRIPTIONS
Orienting description of air traffic control in the Netherlands
[VTH-LR-285] N82-12063
DESIGN ANALYSIS
Air-to-ground MTI radar using a displaced phase center, phased array
A82-14881
The history of the development of the GQ aeroconical parachute - 1971-1980
A82-14961
A look at the Hoffman Triangular parachute - The first successful glidable parachute
A82-14966
Mathematical programming in engineering design problems
A82-15864
Design study report for General Aviation Loran-C receiver
[AD-A104921] N82-12062
Establishment of an experimental technique to provide accurate measurement of the installed drag of close coupled civil nacelle/airframe configurations, using a full span model with turbine powered engine simulators
N82-13089
DETECTION
Sensor failure detection system --- for the F100 turbofan engine
[NASA-CR-165515] N82-13145
DIESEL FUELS
Development of catalytic systems for the conversion of syngas to jet fuel and diesel fuel and higher alcohols
[DE82-000067] N82-12255
DIFFUSION FLAMES
Chemistry of combustion of fuel-water mixtures
[AD-A105401] N82-12178
DIGITAL DATA
Automatic digital gain ranging --- for flight test telemetry data
[AIAA PAPER 81-2370] A82-13947
Airborne Electronic Terrain Map System
A82-14771
DIGITAL FILTERS
The agile transversal filter - A flexible building block for ICNIA --- Integrated Communications, Navigation and Identification Avionics
A82-14765
DIGITAL INTEGRATORS
Techniques for interfacing multiplex systems
[AD-A101457] N82-13135
DIGITAL NAVIGATION
Digital redesign of existing multiloop continuous control systems --- with application to YF-16 aircraft flight controller
A82-13093
Digital control for flexible aircraft using reduced order models
A82-13094
F-4 Advanced Avionics Flight Test
[AIAA PAPER 81-2464] A82-13929
Future directions in CNI integrated avionics
A82-14720

DIGITAL RADAR SYSTEMS
Radar hostile fire location A82-14857
Air-to-ground MTI radar using a displaced phase center, phased array A82-14881
A new approach to radar plot extraction for ATC applications A82-14908

DIGITAL SIMULATION
A failure detection and isolation system for tactical aircraft with separated IMUs A82-14684
Digital simulation of aircraft electrical generating system by means of Sceptre program A82-14820
General purpose real-time interaction panel for digital simulation --- of flight control systems A82-14831
A real time Pegasus propulsion system model for VSTOL piloted simulation evaluation [NASA-TM-82770] N82-13144

DIGITAL SYSTEMS
Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers A82-13451
Integrated avionics - Concepts and concerns [AIAA 81-2211] A82-13452
Digital avionics - What a pilot expects to see [AIAA 81-2217] A82-13455
Applications of digital avionics to commercial transport aircraft - The DC-9 Super 80 and beyond [AIAA 81-2218] A82-13456
The role of avionics in the all electric airplane [AIAA 81-2219] A82-13457
Fault isolation methodology for the L-1011 digital avionic flight control system [AIAA 81-2223] A82-13458
Computer-in-control selection logic for a triplex digital flight control system [AIAA 81-2236] A82-13465
Design and analysis of a digitally controlled integrated flight/fire control system [AIAA 81-2245] A82-13470
ARINC 429 digital data communications on the Boeing 757 and 767 commercial airliners [AIAA 81-2267] A82-13485
Direct digital drive actuation [AIAA 81-2298] A82-13505
Digital detection and processing of laser beacon signals for aircraft collision hazard warning [AIAA 81-2328] A82-13525
Design and flight test of a lateral-directional command augmentation system [AIAA 81-2331] A82-13527
Advanced weapon systems - Integration technology --- Digital Avionic Information System [AIAA 81-2213] A82-13533
F/A-18 high authority/high gain digital flight control system development and flight testing [AIAA PAPER 81-2465] A82-13930
Implementing the DAIS executive --- Digital Avionics Information System software feasibility for aircraft systems A82-14814
Direct digital design method for reconfigurable multivariable control laws for the A-7D Digitac II aircraft A82-14828
Design of direct digital flight-mode control systems for high-performance aircraft A82-14829
Reliability analysis of the F-8 digital fly-by-wire system [NASA-CR-163110] N82-12079
How the helicopter cockpit designer uses digital avionics N82-13049

DIGITAL TECHNIQUES
Digital signal processing on a background of rereflections for the international aircraft landing system A82-13703
Parallel processing applied to digital flight control systems - Some perspectives A82-14794
Microprocessor flight control application study A82-14796

DIRECT CURRENT
Computer modeling of an aircraft HVDC electrical system A82-14819

DIRECTIONAL ANTENNAS
Study of the effects of maneuver compensation on beam pointing accuracy A82-14780

DIRECTIONAL CONTROL
Design and flight test of a lateral-directional command augmentation system [AIAA 81-2331] A82-13527

DIRECTIONAL SOLIDIFICATION (CRYSTALS)
'In situ' composites for jet propulsion and stationary gas turbine applications A82-15824

DISCRETE ADDRESS BEACON SYSTEM
Performance evaluation of target report extractor in the monopulse ATCRBS --- Air Traffic Control Radar Beacon System A82-14776
A multimicroprocessor system for ATCRBS monopulse data processing A82-14777

DISPLACEMENT MEASUREMENT
In-flight deflection measurement of the HiMAT aeroelastically tailored wing [AIAA PAPER 81-2450] A82-14381

DISPLAY DEVICES
Digital avionics - What a pilot expects to see [AIAA 81-2217] A82-13455
Aircraft separation assurance avionics [AIAA 81-2239] A82-13467
Aircraft alerting systems standardization study [AIAA 81-2242] A82-13468
The application of large screen CRT's, touch panels, and voice to the flight stations of the 1990's [AIAA 81-2263] A82-13482
Electronic flight deck displays for transport aircraft [AIAA 81-2264] A82-13483
The electronic terrain map - A new avionics integrator [AIAA 81-2289] A82-13498
The interface of multifunction controls and displays to tomorrow's avionics [AIAA 81-2290] A82-13499
Flat panel developments for future military aircraft [AIAA 81-2302] A82-13507
An integrated control panel utilizing a programmable varistor-multiplexed dichroic liquid crystal display [AIAA 81-2303] A82-13509
Digital avionics display processor [AIAA 81-2311] A82-13513
Advanced display systems for crew stations of tactical aircraft [AIAA 81-2312] A82-13514
Computergraphics for aircraft control [AIAA 81-2313] A82-13515
An advanced programmable/reconfigurable color graphics display system for crew station technology research [AIAA 81-2314] A82-13516
Application of a microprocessor controlled cockpit display for enhanced pilot control of flight test maneuvers [AIAA PAPER 81-2510] A82-13908
A unique integrated flight testing facility for advanced control/display research [AIAA PAPER 81-2490] A82-13919
The development and use of a computer-interactive data acquisition and display system in a flight environment [AIAA PAPER 81-2371] A82-13946
The integration of control and display concepts for improved pilot situational awareness A82-13972
Software considerations in the design of computer generated flight displays A82-14742
A methodology for missile launch envelope display evaluation A82-14744
Airborne color CRT displays A82-14823

The Manoeuvering Flight Path Display - A flight trajectory solution display concept
A82-14824

Computer image generation for flight simulation
A82-15599

Computer-animated predictive displays for microwave landing approaches
A82-15816

Experimental evaluation of a perspective tunnel display for three-dimensional helicopter approaches
A82-15847

Electronic Master Monitor and Advisory Display System (EMMADS)
[AD-A105082] N82-12067

The impact of new guidance and control systems on military aircraft cockpit design
[AGARD-CP-312] N82-13046

Electronic flight deck displays for military transport aircraft
N82-13050

Color CRT displays for the cockpit
N82-13051

Integration of controls and displays in US Army helicopter cockpits
N82-13053

A standard control display unit for multi-aircraft application
N82-13054

Tanker avionics and aircrew complement evaluation
N82-13063

F/A 18 Hornet crew station
N82-13064

Electronic master monitor and advisory display system test and demonstration report
[AD-A105317] N82-13141

DIVERGENCE

Divergence of a sweptforward wing
A82-13560

DIVERTERS

Subsonic military aircraft engine intake: An integrated theoretical experiment design
N82-13073

DOORS

Subsonic military aircraft engine intake: An integrated theoretical experiment design
N82-13073

DRAG MEASUREMENT

Model testing techniques for measuring inlet drag
N82-13084

DRAG REDUCTION

Analysis of escape systems at 687 KEAS
A82-14978

DUCT GEOMETRY

Effects of intake geometry on circular pitot intake performance at zero and low forward speeds
N82-13070

Effect of vacuum exhaust pressure on the performance of MHD ducts at high D-field
[NASA-TM-82750] N82-13908

DYNAMIC CONTROL

The design of exact nonlinear model followers --- with application to trajectory autopilot for helicopter
A82-13125

Application of the concept of dynamic trim control and nonlinear system inverses to automatic control of a vertical attitude takeoff and landing aircraft
[AIAA 81-2238] A82-13466

DYNAMIC LOADS

Measured pavement response to transient aircraft loadings
N82-13442

DYNAMIC MODELS

Performance estimation from non-steady manoeuvres
[AIAA PAPER 81-2424] A82-13863

DYNAMIC PRESSURE

Wind tunnel tests of ejection seat for high dynamic pressure escape
A82-14979

DYNAMIC RESPONSE

Evaluation and wind tunnel tests of the 4,000 lb (normal-force) pitch/yaw and roll dynamic stability balance systems for measuring direct, cross, and cross-coupling derivatives
[AD-A105122] N82-12047

DYNAMIC STABILITY

Direct free-flight analysis of aircraft dynamics at high angles of attack
A82-15596

Robust flight control - A design example
A82-15845

Effects of aerodynamic coupling on the dynamics of roll aircraft
N82-12070

DYNAMIC STRUCTURAL ANALYSIS

A set of finite elements developed for the dynamic computation of composite helicopter blades
[ONERA, TP NO. 1981-87] A82-13990

Application of the ONERA dynamic stall model to a helicopter blade in forward flight
[ONERA, TP NO. 1981-89] A82-13992

Structural dynamics: Modified calculations --- natural and harmonically excited vibrations of modified structures; increased computation efficiency
[BMVG-FBWT-81-1] N82-13457

DYNAMIC TESTS

An advanced facility for processing aircraft dynamic test data
[AIAA PAPER 81-2398] A82-14377

An acquisition and analysis system for dynamic tests of air inlets
N82-13082

E

ECONOMIC ANALYSIS

Transportation systems evaluation methodology development and applications, phase 3
[NASA-CR-164999] N82-12051

ECONOMIC IMPACT

The FAA's proposed helicopter certification rules
A82-13242

EGRESS

Emergency in-flight egress for general aviation aircraft
A82-14953

EIGENVALUES

A set of finite elements developed for the dynamic computation of composite helicopter blades
[ONERA, TP NO. 1981-87] A82-13990

EJECTION INJURIES

Wind tunnel tests of ejection seat for high dynamic pressure escape
A82-14979

Post ejection survival
A82-14981

EJECTION SEATS

Escape systems decelerator technology
[AIAA PAPER 81-1913] A82-13966

Testing of the SJU-5A ejection seat for the F/A-18 /HORNET/ aircraft
A82-14955

Further test results of parachutes with automatic inflation modulation /A.I.M./
A82-14965

Analysis of escape systems at 687 KEAS
A82-14978

Wind tunnel tests of ejection seat for high dynamic pressure escape
A82-14979

Performance assessment of the ACES-II ejection seat-A-10 configuration
A82-14980

Post ejection survival
A82-14981

Terrain actuated deployment system --- radar altimeter for man-ejector seat separation
A82-14982

EJECTORS

Investigation of acoustic interactions in jet thrust augmenting ejectors
[AD-A106083] N82-13835

ELASTIC DAMPING

Design for active and passive flutter suppression and gust alleviation
[NASA-CR-3482] N82-13147

ELASTIC DEFORMATION

In-flight deflection measurement of the HiMAT aeroelastically tailored wing
[AIAA PAPER 81-2450] A82-14381

ELECTRIC EQUIPMENT
Computer modeling of an aircraft HVDC electrical system
A82-14819
Computer simulation of an advanced aircraft electrical system
A82-14821
ELECTRIC GENERATORS
60 kVA ADP permanent magnet VSCF starter generator system - A program overview --- Variable Speed Constant Frequency
A82-14789
ELECTRIC POWER
Will power-by-wire replace power-by-hydraulics
A82-14707
The all electric airplane - Its development and logistic support
A82-14709
ELECTRIC POWER SUPPLIES
Conceptual design of an integrated power and avionics information system
A82-14788
60 kVA ADP permanent magnet VSCF starter generator system - A program overview --- Variable Speed Constant Frequency
A82-14789
High speed PMG containment study for VSCF system --- Permanent Magnet Generator for Variable Speed Constant Frequency applications
A82-14791
Computer simulation of an advanced aircraft electrical system
A82-14821
ELECTRICAL ENGINEERING
Compilation of abstracts of dissertations theses, and research papers submitted by candidates for degrees, 1 October 1979 - 30 September 1980
[AD-A104124] N82-13974
ELECTRO-OPTICAL PHOTOGRAPHY
Weather impact on low-altitude imaging infrared sensors in Europe - An availability model
A82-14779
ELECTRO-OPTICS
The TADS/PNVS 'eyes' for the AH-64 attack helicopter
A82-13239
Electro-optical vector scoring system --- for missile miss distance in fleet training exercises
[AIAA PAPER 81-2373] A82-13945
ELECTROCHEMICAL MACHINING
Attack on superalloys by chemical and electrolytic processes
A82-14365
ELECTROMAGNETIC COMPATIBILITY
The Navy F/A-18A Hornet electromagnetic compatibility program
A82-14760
ELECTROMAGNETIC INTERACTIONS
Georgia Tech coherent jammer flight test
[AIAA PAPER 81-2452] A82-13898
A concept for a high-accuracy, low-cost accelerometer
A82-14685
Assessment methodology of the lightning threat to advanced aircraft
A82-14759
ELECTROMAGNETIC INTERFERENCE
Fiber-optic immunity to EMI/EMP for military aircraft
[AIAA 81-2339] A82-13529
ELECTROMAGNETIC PULSES
Fiber-optic immunity to EMI/EMP for military aircraft
[AIAA 81-2339] A82-13529
A recursive time domain analysis of distributed line grid networks with application to the LTA/EMP problem --- Lightning Threat Analysis
A82-14761
ELECTROMAGNETIC SHIELDING
The Navy F/A-18A Hornet electromagnetic compatibility program
A82-14760
ELECTROMAGNETS
60 kVA ADP permanent magnet VSCF starter generator system - A program overview --- Variable Speed Constant Frequency
A82-14789
ELECTROMECHANICAL DEVICES
Electromechanical actuation development program
A82-14705
New all-electric-system technology --- electromechanical actuators for aircraft
A82-14710
High speed PMG containment study for VSCF system --- Permanent Magnet Generator for Variable Speed Constant Frequency applications
A82-14791
ELECTRONIC AIRCRAFT
The role of avionics in the all electric airplane
[AIAA 81-2219] A82-13457
The all electric airplane - Its development and logistic support
A82-14709
New all-electric-system technology --- electromechanical actuators for aircraft
A82-14710
Airborne Electronic Map Systems. I - Design
A82-14770
Airborne Electronic Terrain Map System
A82-14771
ELECTRONIC CONTROL
Algorithms for an adaptive dynamic window in electronic map systems
A82-14769
Failure analysis of variable reluctance stepper motor --- in electronic fuel control system on jet engine
A82-14792
ELECTRONIC EQUIPMENT
Electronic flight deck displays for transport aircraft
[AIAA 81-2264] A82-13483
The Advanced Range Instrumentation Aircraft improvement and modernization program
[AIAA PAPER 81-2368] A82-13948
Airborne Electronic Terrain Map System. II - Applications
A82-14773
ELECTRONIC WARFARE
The TADS/PNVS 'eyes' for the AH-64 attack helicopter
A82-13239
Advanced fiber optic systems for avionics applications
[AIAA 81-2319] A82-13518
Study of the effects of maneuver compensation on beam pointing accuracy
A82-14780
ELEVATORS (CONTROL SURFACES)
Trim tab excitation system for the BAe 146
A82-14363
ELLIPTIC DIFFERENTIAL EQUATIONS
Rapid elliptic solvers
A82-15827
EMERGENCIES
Flight testing the suspended maneuvering system --- helicopter firefighting and rescue techniques
[AIAA PAPER 81-2498] A82-13922
ENERGY CONSERVATION
Airplane performance sensitivities to lateral and vertical profiles
A82-15846
Analysis of integrated fuel-efficient, low-noise procedures in terminal-area operations
[DE81-029833] N82-13014
ENGINE CONTROL
The role of avionics in the all electric airplane
[AIAA 81-2219] A82-13457
Recent propulsion system flight tests at the NASA Dryden Flight Research Center
[AIAA PAPER 81-2438] A82-13874
The development and flight test evaluation of an integrated propulsion control system for the HiMAT research airplane
[AIAA PAPER 81-2467] A82-13931
Failure analysis of variable reluctance stepper motor --- in electronic fuel control system on jet engine
A82-14792
Sensor failure detection system --- for the F100 turbofan engine
[NASA-CR-165515] N82-13145
ENGINE COOLANTS
Flight test method for the determination of reciprocating engine cooling requirements
[AIAA PAPER 81-2446] A82-13870
The operational characteristics of turbojets, giving particular attention to the cooled high-pressure turbine
A82-14414

ENGINE DESIGN
  Creep and aero gas turbine design
    A82-12987
  An approach to robust nonlinear control design --- with illustration of J-85 turbojet engine simulation
    A82-13128
  CT7 - GE attacks commuter turboprop market
    A82-15950
  Aerodynamic aspects of a high bypass ratio engine installation on a fuselage afterbody
    N82-13093
  An aerodynamic design and the overall stage performance of an air-cooled axial-flow turbine
    [NAL-TR-321T] N82-13109

ENGINE INLETS
  A large-scale investigation of engine influence on inlet performance at angle-of-attack
    [AIAA PAPER 81-2481] A82-13939
  Effect of a part span variable inlet guide vane on TF34 fan performance
    [NASA-CR-165458] N82-12075
  Aerodynamics of Power Plant Installation
    [AGARD-CP-301] N82-13065
  Performance of highly integrated inlets for supersonic aircraft
    N82-13066
  Some RAE research on shielded and unshielded fuselage mounted air intakes at subsonic and supersonic speeds
    N82-13068
  Prediction and measurement of time-variant, three-dimensional flows in military aircraft intakes
    N82-13069
  Effects of intake geometry on circular pitot intake performance at zero and low forward speeds
    N82-13070
  Subsonic military aircraft engine intake: An integrated theoretical experiment design
    N82-13073
  The design and development of the Tornado engine air intake
    N82-13074
  Wind tunnel tests of powered models: A comparison of two methods of simulating the jets of jet engines
    N82-13087
  Numerical analysis of the scramjet-inlet flow field by using two-dimensional Navier-Stokes equations
    [NASA-TP-1940] N82-13142

ENGINE STARTERS
  60 kVA ADP permanent magnet VSCF starter generator system - A program overview --- Variable Speed Constant Frequency
    A82-14789

ENGINE TESTS
  Recent propulsion system flight tests at the NASA Dryden Flight Research Center
    [AIAA PAPER 81-2438] A82-13874
  Performance assessment of an advanced reheated turbo fan engine
    [AIAA PAPER 81-2447] A82-13879

ENGINEERING MANAGEMENT
  Organizing and training for innovative flight test management
    [AIAA PAPER 81-2416] A82-13856

ENVIRONMENT EFFECTS
  Transportation systems evaluation methodology development and applications, phase 3
    [NASA-CR-164999] N82-12051

ENVIRONMENT SIMULATION
  Helicopter icing
    A82-13243

EQUIPMENT
  The impact of new guidance and control systems on military aircraft cockpit design
    [AGARD-CP-312] N82-13048

EQUIPMENT SPECIFICATIONS
  Practical aspects of instrumentation system installation, volume 13
    [NASA-TM-84067] N82-13140

ERROR ANALYSIS
  Evaluating sources of error in EAR/GEANS navigation using a Kalman postprocessor --- Electronically Agile Radar/Gimbaled Electrically suspended gyro Airborne Navigation System
    A82-14739

  Compressor stall inducing installation effects of an engine control parameter for the CF-5 aircraft
    N82-13085

ESCAPE SYSTEMS
  Escape systems decelerator technology
    [AIAA PAPER 81-1913] A82-13966
  Emergency in-flight egress for general aviation aircraft
    A82-14953
  Wind tunnel tests of ejection seat for high dynamic pressure escape
    A82-14979
  A ballistic design model for initiators for aircraft personnel escape systems
    A82-14984
  Analytical and experimental characterization of the JAU-14/A cartridge actuated initiator for use in aircrew escape system performance evaluation
    A82-14985

EUTECTIC ALLOYS
  'In situ' composites for jet propulsion and stationary gas turbine applications
    A82-15824

EVALUATION
  Naval Weapons Center - Test and evaluation in the 1980's
    [AIAA PAPER 81-2485] A82-13940

EXCITATION
  Trim tab excitation system for the BAe 146
    A82-14363

EXHAUST EMISSION
  Effect of fuel-air-ratio nonuniformity on emissions of nitrogen oxides
    [NASA-TP-1798] N82-13143

EXHAUST FLOW SIMULATION
  Wind tunnel test and analysis techniques using powered simulators for civil nacelle installation drag assessment
    N82-13088
  Establishment of an experimental technique to provide accurate measurement of the installed drag of close coupled civil nacelle/airframe configurations, using a full span model with turbine powered engine simulators
    N82-13089

EXHAUST NOZZLES
  An investigation of F-16 nozzle-afterbody forces at transonic Mach numbers with emphasis on model scale effects
    [AD-A104905] N82-12392
  Aerodynamics of Power Plant Installation
    [AGARD-CP-301] N82-13065
  Integration of advanced exhaust nozzles
    N82-13075
  Advanced exhaust nozzle technology
    N82-13078
  Evaluation of an experimental technique to investigate the effects of the engine position on engine/pylon/wing interference
    N82-13090

EXHAUST SYSTEMS
  Investigation of acoustic interactions in jet thrust augmenting ejectors
    [AD-A106083] N82-13835

EXPERIMENTAL DESIGN
  The influence of closed-coupled, rear fuselage mounted nacelles on the design of an advanced high speed wing
    N82-13092

EXPLOSIONS
  Investigation of the structural degradation and personnel hazards resulting from helicopter composite structures exposed to fires and/or explosions
    [AD-A104757] N82-12057

EXTERNAL STORES
  Prediction of aerodynamic loads on aircrafts with external stores at transonic speeds
    N82-13813

F

F-4 AIRCRAFT
  F-4 Advanced Avionics Flight Test
    [AIAA PAPER 81-2464] A82-13929

F-14 AIRCRAFT
Fleet Flight Loads Survey monitoring and analysis techniques
[AIAA PAPER 81-2461] A82-13903
Flight test experience with high-alpha control system techniques on the F-14 airplane
[AIAA PAPER 81-2505] A82-13906
Limited evaluation of an F-14A airplane utilizing an aileron-rudder interconnect control system in the landing configuration
[NASA-TM-81972] N82-13148
F-15 AIRCRAFT
The use of separated multifunction inertial sensors for flight control
[AIAA 81-2295] A82-13502
Redundancy management of skewed and dispersed inertial sensors
[AIAA 81-2296] A82-13503
Enhanced F-15 air-to-ground flight demonstrations
[AIAA PAPER 81-2413] A82-13854
Fighters - Improving the breed
A82-14354
Status and tracking system for flight test data products
[AIAA PAPER 81-2395] A82-14376
A methodology for missile launch envelope display evaluation
A82-14744
Assessing pilot workload - Without disturbing pilot behavior
A82-14745
F-15 SAR
A82-14938
F-16 AIRCRAFT
Digital redesign of existing multiloop continuous control systems --- with application to YF-16 aircraft flight controller
A82-13093
The F-16/79 test program
[AIAA PAPER 81-2414] A82-13855
Fighters - Improving the breed
A82-14354
Advanced fighter technology integration AFTI/F-16 test program overview
[AIAA PAPER 81-2353] A82-14398
The design and implementation of a canned scenario function for the F-16 dynamic system simulator
A82-14678
Design of direct digital flight-mode control systems for high-performance aircraft
A82-14829
An investigation of F-16 nozzle-afterbody forces at transonic Mach numbers with emphasis on model scale effects
[AD-A104905] N82-12392
F-18 AIRCRAFT
F/A-18A weapon system - 1976 state of the art
[AIAA 81-2215] A82-13453
F/A-18 'Hornet' - One man operability
[AIAA 81-2266] A82-13484
Avionics systems simulation for the Northrop F/A-18L aircraft
[AIAA 81-2274] A82-13488
F/A-18 high authority/high gain digital flight control system development and flight testing
[AIAA PAPER 81-2465] A82-13930
F/A-18 Flight Test program overview - 1 September 1981
[AIAA PAPER 81-2351] A82-13955
The Navy F/A-18A Hornet electromagnetic compatibility program
A82-14760
F/A-18A high angle of attack/spin testing
A82-14934
F/A-18 roll rate improvement program
A82-14939
Testing of the SJU-5A ejection seat for the F/A-18 /HORNET/ aircraft
A82-14955
F/A 18 Hornet crew station
N82-13064
F-106 AIRCRAFT
Thunderstorm hazards flight research - Program overview
[AIAA PAPER 81-2412] A82-13853
Operational evaluation of thunderstorm penetration test flights during project Storm Hazards '80
A82-14954
Investigation of severe lightning strike incidents to two USAF F-106A aircraft
[NASA-CR-165794] N82-12052
F-111 AIRCRAFT
Pave Mover Flight Test Program
[AIAA PAPER 81-2492] A82-14380
FAIL-SAFE SYSTEMS
The SIFT computer and its development --- Software Implemented Fault Tolerance for aircraft control
[AIAA 81-2278] A82-13490
General purpose real-time interaction panel for digital simulation --- of flight control systems
A82-14831
FAILURE ANALYSIS
Fault detection for two physically separated, communicating inertial measurement units
A82-13142
Theoretical analysis of wake-induced parachute collapse
[AIAA PAPER 81-1922] A82-13963
A failure detection and isolation system for tactical aircraft with separated IMUs
A82-14684
Failure analysis of variable reluctance stepper motor --- in electronic fuel control system on jet engine
A82-14792
FAIRINGS
Techniques for modifying airfoils and fairings on aircraft using foam and fiberglass
[AIAA PAPER 81-2445] A82-14383
FAN BLADES
Thrust modulation methods for a subsonic V/STOL aircraft
[NASA-TM-82747] N82-13112
FATIGUE (MATERIALS)
Fatigue methodology - A technical management system for helicopter safety and durability
A82-13240
Flight trail of the Aircraft Fatigue Data Analysis System (AFDAS) Mk 2 prototype
[AD-A105270] N82-12066
FATIGUE LIFE
Creep and aero gas turbine design
A82-12987
In-flight computation of helicopter transmission fatigue life expenditure
[AIAA PAPER 81-2434] A82-13872
Effect of fighter attack spectrum on composite fatigue life
[AD-A105034] N82-12143
FAULT TOLERANCE
Fault detection for two physically separated, communicating inertial measurement units
A82-13142
Fault isolation methodology for the L-1011 digital avionic flight control system
[AIAA 81-2223] A82-13458
Computer-in-control selection logic for a triplex digital flight control system
[AIAA 81-2236] A82-13465
The SIFT computer and its development --- Software Implemented Fault Tolerance for aircraft control
[AIAA 81-2278] A82-13490
A failure detection and isolation system for tactical aircraft with separated IMUs
A82-14684
FEASIBILITY ANALYSIS
Implementing the DAIS executive --- Digital Avionics Information System software feasibility for aircraft systems
A82-14814
Transportation systems evaluation methodology development and applications, phase 3
[NASA-CR-164999] N82-12051
FEEDBACK CONTROL
A dual input actuator for fluidic backup flight control
A82-13088
Digital redesign of existing multiloop continuous control systems --- with application to YF-16 aircraft flight controller
A82-13093
Comparison between the exact and an approximate feedback solution for medium range interception problems
A82-13106

The design of exact nonlinear model followers --- with application to trajectory autopilot for helicopter A82-13125
The use of observers on relaxed static stability aircraft A82-14740
A synthesis technique for highly uncertain and interacting multivariable flight control systems A82-14827
Acceptance testing of the Calspan variable stability Learjet A82-14937
Experimental and analytical studies of advanced air cushion landing systems [NASA-CR-3476] N82-12065
Computational methods of robust controller design for aerodynamic flutter suppression [NASA-CR-164983] N82-12080

FIBER OPTICS
Advanced fiber optic systems for avionics applications [AIAA 81-2319] A82-13518
Fiber-optic immunity to EMI/EMP for military aircraft [AIAA 81-2339] A82-13529
Portable air driven variable speed fiber optic cable termination polisher [AD-A104797] N82-12448

FIELD OF VIEW
The LANTIRN wide field-of-view raster Head-Up Display --- Low Altitude Navigation and Targeting IR for Night A82-14825

FIGHTER AIRCRAFT
Air-to-air combat analysis - Review of differential-gaming approaches A82-13115
Wing/store flutter - An active adaptive control application A82-13122
Fault detection for two physically separated, communicating inertial measurement units A82-13142
Avionics implications from weapon system operational utility studies on Manned Air Combat Simulators [AIAA 81-2230] A82-13463
Application of the concept of dynamic trim control and nonlinear system inverses to automatic control of a vertical attitude takeoff and landing aircraft [AIAA 81-2238] A82-13466
Joint Tactical Microwave Landing System /JTMLS/ airborne signal processing [AIAA 81-2247] A82-13471
An update of an integrated CNI system - TIES --- Communication, Navigation, and Identification provided by Tactical Information Exchange System [AIAA 81-2292] A82-13500
Time-referencing of data in an asynchronous environment --- for fighter aircraft avionics [AIAA 81-2341] A82-13531
The development of cryogenic wind tunnels and their application to maneuvering aircraft technology A82-13971
Techniques for modifying airfoils and fairings on aircraft using foam and fiberglass [AIAA PAPER 81-2445] A82-14383
A failure detection and isolation system for tactical aircraft with separated IMUs A82-14684
Will power-by-wire replace power-by-hydraulics A82-14707
Integrated Flight/Weapon Control design and evaluation A82-14741
The influence of smart computers on the cockpit of the future A82-14743
Evaluation of advanced air-to-air gunnery fire control systems A82-14750
Airborne color CRT displays A82-14823
A synthesis technique for highly uncertain and interacting multivariable flight control systems A82-14827
Robust flight control - A design example A82-15845
Aerodynamics && Power Plant Installation [AGARD-CP-301] N82-13065
Performance of highly integrated inlets for supersonic aircraft N82-13066
Some RAE research on shielded and unshielded fuselage mounted air intakes at subsonic and supersonic speeds N82-13068
Prediction and measurement of time-variant, three-dimensional flows in military aircraft intakes N82-13069
The subsonic performance of practical military variable area convergent nozzles N82-13076
Final report on the FuePo-4 major theme: Interference drag with airframe/engine integration on fighter aircraft [BMVG-FBWT-79-20] N82-13116
Maneuver load control for the reduction of design loads and improvement of the maneuverability of modern fighter aircraft [BMVG-FBWT-81-2] N82-13138

FINITE DIFFERENCE THEORY
Calculation of wing-body-nacelle interference in subsonic and transonic potential flow N82-13095
Numerical analysis of the scramjet-inlet flow field by using two-dimensional Navier-Stokes equations [NASA-TP-1940] N82-13142

FINITE VOLUME METHOD
Remarks on the calculation of transonic potential flow by a finite volume method A82-15835

FIRE CONTROL
Design and analysis of a digitally controlled integrated flight/fire control system [AIAA 81-2245] A82-13470
Evaluation of advanced air-to-air gunnery fire control systems A82-14750

FIRE EXTINGUISHERS
Fire extinguishant materials [NASA-CASE-ARC-11252-1] N82-12168
Development and testing of dry chemicals in advanced extinguishing systems for jet engine nacelle fires [NASA-CR-165011] N82-13186

FIRE FIGHTING
Flight testing the suspended maneuvering system --- helicopter firefighting and rescue techniques [AIAA PAPER 81-2498] A82-13922

FIRES
Investigation of the structural degradation and personnel hazards resulting from helicopter composite structures exposed to fires and/or explosions [AD-A104757] N82-12057

FIXED WINGS
Wing design for light transport aircraft with improved fuel economy A82-14416
Crashworthy military passenger seat development A82-14976

FLAME RETARDANTS
Formulation and characterization of polyimide resilient foams of various densities for aircraft seating applications [NASA-CR-167421] N82-12230

FLAPS (CONTROL SURFACES)
Navy spin evaluation of the A-7 airplane configured with automatic maneuvering flaps A82-14933

FLAT PLATES
Turbulent wake development behind streamlined bodies N82-13104

FLEXIBLE BODIES
Digital control for flexible aircraft using reduced order models A82-13094
Modeling procedures for handling qualities evaluation of flexible aircraft A82-13968

FLIGHT ALTITUDE
  On-line optimization of aircraft altitude and flight path angle dynamics A82-13107
FLIGHT CHARACTERISTICS
  A decoupled control system for improved flight performance in wind shear A82-13079
  Government testing [AIAA PAPER 81-2443] A82-13877
  Selected stability and control derivatives from the first Space Shuttle entry [AIAA PAPER 81-2451] A82-13880
  Powered-lift STOL aircraft shipboard operations - A comparison of simulation, land-based and sea trial results for the QSRA --- Quiet Short-haul Research Aircraft [AIAA PAPER 81-2480] A82-13938
  AD-1 oblique wing aircraft program [AIAA PAPER 81-2354] A82-14390
FLIGHT CLOTHING
  Evaluation of a selected group of anti-exposure garment configurations for their effects on the operational performance and survival of Naval aircrewmen A82-14972
FLIGHT CONTROL
  A decoupled control system for improved flight performance in wind shear A82-13079
  A dual input actuator for fluidic backup flight control A82-13088
  Fault detection for two physically separated, communicating inertial measurement units A82-13142
  Integrated avionics - Concepts and concerns [AIAA 81-2211] A82-13452
  Digital avionics - What a pilot expects to see [AIAA 81-2217] A82-13455
  The role of avionics in the all electric airplane [AIAA 81-2219] A82-13457
  Fault isolation methodology for the L-1011 digital avionic flight control system [AIAA 81-2223] A82-13458
  Computer-in-control selection logic for a triplex digital flight control system [AIAA 81-2236] A82-13465
  Design and analysis of a digitally controlled integrated flight/fire control system [AIAA 81-2245] A82-13470
  The use of separated multifunction inertial sensors for flight control [AIAA 81-2295] A82-13502
  Redundancy management of skewed and dispersed inertial sensors [AIAA 81-2296] A82-13503
  Development and laboratory test of an integrated sensory system /ISS/ for advanced aircraft [AIAA 81-2297] A82-13504
  Enhanced F-15 air-to-ground flight demonstrations [AIAA PAPER 81-2413] A82-13854
  Flight experience with a remotely augmented vehicle flight test technique [AIAA PAPER 81-2417] A82-13857
  A cost effective method for the control of roll due to side slip on a low speed aircraft [AIAA PAPER 81-2422] A82-13861
  F/A-18 high authority/high gain digital flight control system development and flight testing [AIAA PAPER 81-2465] A82-13930
  Comparison of low-speed handling qualities in ground-based and in-flight simulator tests [AIAA PAPER 81-2478] A82-13936
  Experience with flight test trajectory guidance [AIAA PAPER 81-2504] A82-14379
  Navigation for helicopters by multiple use of inertial sensors A82-14713
  Evaluation of advanced air-to-air gunnery fire control systems A82-14750
  Passive terrain following using stored map and global positioning system A82-14772
  Design of direct digital flight-mode control systems for high-performance aircraft A82-14829
  USNTPS spin program A82-14931
  Robust flight control - A design example A82-15045
  Fixed gain controller design for aircraft [AD-A104877] N82-12081
  Limited evaluation of an F-14A airplane utilizing an aileron-rudder interconnect control system in the landing configuration [NASA-TM-81972] N82-13148
  Interactive aircraft flight control and aeroelastic stabilization --- forward swept wing flight vehicles [NASA-CR-165036] N82-13150
FLIGHT CREWS
  High-accuracy ranging over voice radios for downed aircrew rescue A82-14694
  Rescue at sea A82-14956
  'Little people' problem /MA-2 torso harness/ A82-14958
  A new safety harness for mobile aircrew A82-14963
  Evaluation of a selected group of anti-exposure garment configurations for their effects on the operational performance and survival of Naval aircrewmen A82-14972
  Test and evaluation of improved aircrew restraint systems A82-14974
  HASEP - Survival from crashed Navy helicopters A82-14977
  Analytical and experimental characterization of the JAU-14/A cartridge actuated initiator for use in aircrew escape system performance evaluation A82-14985
  Tanker avionics and aircrew complement evaluation N82-13063
  F/A 18 Hornet crew station N82-13064
  Group 1: Scenario design and development issues N82-13131
FLIGHT HAZARDS
  Thunderstorm hazards flight research - Program overview [AIAA PAPER 81-2412] A82-13853
  Direct strike lightning measurement system --- for aircraft [AIAA PAPER 81-2513] A82-13910
FLIGHT INSTRUMENTS
  Software considerations in the design of computer generated flight displays A82-14742
FLIGHT LOAD RECORDERS
  Fleet Flight Loads Survey monitoring and analysis techniques [AIAA PAPER 81-2461] A82-13903
  Comparison of wind tunnel and theoretical aeroelastic predictions with flight measured airloads for the B-1 aircraft [AIAA PAPER 81-2387] A82-14393
FLIGHT OPERATIONS
  The influence of wind shear and vertical winds on takeoffs and go-arounds A82-15623
FLIGHT OPTIMIZATION
  Real-time flight management avionics software system [AIAA 81-2340] A82-13530
  Flight management systems for modern jet aircraft A82-14778
  Airplane performance sensitivities to lateral and vertical profiles A82-15846
FLIGHT PATHS
  Darboux points in minimum-fuel aircraft landing problems A82-13077
  On-line optimization of aircraft altitude and flight path angle dynamics A82-13107
  Computergraphics for aircraft control [AIAA 81-2313] A82-13515
  Development of an MLS lateral autoland system with automatic path definition [AIAA PAPER 81-1751] A82-13993

The Maneuvering Flight Path Display - A flight trajectory solution display concept
A82-14824

Application of singular perturbation theory
N82-12050

FLIGHT SAFETY

Safety of helicopters in flight --- Russian book
A82-14946

A new safety harness for mobile aircrew
A82-14963

Computer Air Carrier Symposium
[AD-A104894] N82-12054

Summary of Federal Aviation Administration responses to National Transportation Safety Board safety recommendations
[AD-A104922] N82-12055

Orienting description of air traffic control in the Netherlands
[VTH-LR-285] N82-12063

FLIGHT SIMULATION

Avionics implications from weapon system operational utility studies on Manned Air Combat Simulators
[AIAA 81-2230] A82-13463

Avionics systems simulation for the Northrop F/A-18L aircraft
[AIAA 81-2274] A82-13488

The need for, and development of, a simulation facility at the Naval Air Test Center
[AIAA PAPER 81-2488] A82-13917

Powered-lift STOL aircraft shipboard operations - A comparison of simulation, land-based and sea trial results for the QSRA --- Quiet Short-haul Research Aircraft
[AIAA PAPER 81-2480] A82-13938

Jet V/STOL wind-tunnel simulation and groundplane effects
A82-13973

A review of flight-to-wind tunnel drag correlation
[AIAA PAPER 81-2475] A82-14382

Evaluating sources of error in EAR/GEANS navigation using a Kalman postprocessor --- Electronically Agile Radar/Gimbaled Electrically suspended gyro Airborne Navigation System
A82-14739

General purpose real-time interaction panel for digital simulation --- of flight control systems
A82-14831

Inverse SAR and its application to aircraft classification
A82-14871

Computer image generation for flight simulation
A82-15599

The effect of visual information on manual approach and landing
[NLR-MP-80019-U] N82-12064

Use of a helmet-mounted matrix display for presenting energy-maneuverability information during simulated close combat
N82-13061

FLIGHT SIMULATORS

Low cost programmable multisimulator facility
[AIAA 81-2229] A82-13534

Commentary on facilities used in the development of a Sea Harrier all weather operations capability
[AIAA PAPER 81-2407] A82-13892

Comparison of low-speed handling qualities in ground-based and in-flight simulator tests
[AIAA PAPER 81-2478] A82-13936

The design and implementation of a canned scenario function for the F-16 dynamic system simulator
A82-14678

A real time Pegasus propulsion system model for VSTOL piloted simulation evaluation
[NASA-TM-82770] N82-13144

FLIGHT TEST INSTRUMENTS

Practical aspects of instrumentation system installation, volume 13
[NASA-TM-84067] N82-13140

FLIGHT TESTS

On matching the systems identification technique to the particular application --- in evaluating flight test data
A82-13119

Determining hinge moments and empennage airload parameters from flight data for Learjet airplanes
A82-13120

Aircraft separation assurance avionics
[AIAA 81-2239] A82-13467

The use of separated multifunction inertial sensors for flight control
[AIAA 81-2295] A82-13502

Design and flight test of a lateral-directional command augmentation system
[AIAA 81-2331] A82-13527

Powered-lift takeoff performance characteristics determined from flight test of the Quiet Short-haul Research Aircraft /QSRA/
[AIAA PAPER 81-2409] A82-13852

Enhanced F-15 air-to-ground flight demonstrations
[AIAA PAPER 81-2413] A82-13854

The F-16/79 test program
[AIAA PAPER 81-2414] A82-13855

Organizing and training for innovative flight test management
[AIAA PAPER 81-2416] A82-13856

Flight experience with a remotely augmented vehicle flight test technique
[AIAA PAPER 81-2417] A82-13857

A technique to determine lift and drag polars in flight and their application
[AIAA PAPER 81-2420] A82-13859

Navy performance modeling techniques
[AIAA PAPER 81-2431] A82-13869

HiMAT aerodynamic design and flight test experience
[AIAA PAPER 81-2433] A82-13871

Advancing blade concept /ABC/ development test program
[AIAA PAPER 81-2437] A82-13873

Recent propulsion system flight tests at the NASA Dryden Flight Research Center
[AIAA PAPER 81-2438] A82-13874

The Cessna T303 Crusader
[AIAA PAPER 81-2440] A82-13876

Government testing
[AIAA PAPER 81-2443] A82-13877

Flight test method for the determination of reciprocating engine cooling requirements
[AIAA PAPER 81-2446] A82-13878

Planning a helicopter flight test program
[AIAA PAPER 81-2381] A82-13881

Recent improvements at the Naval Air Test Center for increased test system flexibility
[AIAA PAPER 81-2392] A82-13888

Flight testing the nonmetallic spline coupling technology at the Naval Air Test Center
[AIAA PAPER 81-2405] A82-13891

Information technology and its impact on test and evaluation at the Naval Air Test Center
[AIAA PAPER 81-2396] A82-13894

Georgia Tech coherent jammer flight test
[AIAA PAPER 81-2452] A82-13898

Fleet Flight Loads Survey monitoring and analysis techniques
[AIAA PAPER 81-2461] A82-13903

Flight test experience with high-alpha control system techniques on the F-14 airplane
[AIAA PAPER 81-2505] A82-13906

Flight testing De Havilland Aircraft Limited DASH-8 utilizing onboard data analysis by microprocessor
[AIAA PAPER 81-2507] A82-13907

Application of a microprocessor controlled cockpit display for enhanced pilot control of flight test maneuvers
[AIAA PAPER 81-2510] A82-13908

Instrumentation to determine the suitability of RNAV systems for helicopter navigation in the national airspace system /NAS/
[AIAA PAPER 81-2514] A82-13911

The Air Force Flight Test Center - Utah Test and Training Range in the 1980's
[AIAA PAPER 81-2487] A82-13916

The need for, and development of, a simulation facility at the Naval Air Test Center
[AIAA PAPER 81-2488] A82-13917

A unique integrated flight testing facility for advanced control/display research
[AIAA PAPER 81-2490] A82-13919

Flight testing the suspended maneuvering system --- helicopter firefighting and rescue techniques
[AIAA PAPER 81-2498] A82-13922

Improved techniques for the calibration and measurement of in-flight loads
[AIAA PAPER 81-2502] A82-13924

Overview of flight and ground testing with emphasis on the wind tunnel
[AIAA PAPER 81-2474] A82-13928

F-4 Advanced Avionics Flight Test
[AIAA PAPER 81-2464] A82-13929
F/A-18 high authority/high gain digital flight control system development and flight testing
[AIAA PAPER 81-2465] A82-13930
The development and flight test evaluation of an integrated propulsion control system for the HiMAT research airplane
[AIAA PAPER 81-2467] A82-13931
Comparison of low-speed handling qualities in ground-based and in-flight simulator tests
[AIAA PAPER 81-2478] A82-13936
Powered-lift STOL aircraft shipboard operations - A comparison of simulation, land-based and sea trial results for the QSRA --- Quiet Short-haul Research Aircraft
[AIAA PAPER 81-2480] A82-13938
Two at a time - Flight test plans for the new Boeing airliners
[AIAA PAPER 81-2378] A82-13941
Flight test concept evolution
[AIAA PAPER 81-2375] A82-13944
The development and use of a computer-interactive data acquisition and display system in a flight environment
[AIAA PAPER 81-2371] A82-13946
Automatic digital gain ranging --- for flight test telemetry data
[AIAA PAPER 81-2370] A82-13947
F/A-18 Flight Test program overview - 1 September 1981
[AIAA PAPER 81-2351] A82-13955
Navstar Global Positioning System flight test program overview
[AIAA PAPER 81-2350] A82-13956
Development of a lifting parachute to provide self-dispersing capability for an Avco-designed tactical munition
[AIAA PAPER 81-1920] A82-13962
Status and tracking system for flight test data products
[AIAA PAPER 81-2395] A82-14376
An advanced facility for processing aircraft dynamic test data
[AIAA PAPER 81-2398] A82-14377
Experience with flight test trajectory guidance
[AIAA PAPER 81-2504] A82-14379
Pave Mover Flight Test Program
[AIAA PAPER 81-2492] A82-14380
In-flight deflection measurement of the HiMAT aeroelastically tailored wing
[AIAA PAPER 81-2450] A82-14381
KC-10, flight test program management - The contractor's viewpoint
[AIAA PAPER 81-2380] A82-14384
62% manned aircraft demonstrator - Next generation trainer --- cost effective pilot trainer
[AIAA PAPER 81-2519] A82-14385
Hover tests of the XV-15 Tilt Rotor Research Aircraft
[AIAA PAPER 81-2501] A82-14386
Testing capabilities of the 3246th Test Wing
[AIAA PAPER 81-2484] A82-14387
Integrated flight testing based on nonlinear system identification data processing techniques
[AIAA PAPER 81-2449] A82-14389
Applications of covariance analysis simulation to avionics flight testing
A82-14767
Flight management systems for modern jet aircraft
A82-14778
The X-14 - 24 years of V/STOL flight testing
A82-14927
Ball-Bartoe Jetwing flight tests
A82-14928
Flight investigations of integrated descent rate control systems
A82-14929
Progress report - CH-47 modernization program
A82-14930
USNTPS spin program
A82-14931
The USAF Test Pilot School high angle of attack and spin training program
A82-14932
Navy spin evaluation of the A-7 airplane configured with automatic maneuvering flaps
A82-14933
F/A-18A high angle of attack/spin testing
A82-14934
KC-10 flight test program
A82-14935
The all composite Lear Fan 2100
A82-14936
Acceptance testing of the Calspan variable stability Learjet
A82-14937
F/A-18 roll rate improvement program
A82-14939
AV-8B technical update - Leading edge root extension development
A82-14940
Operational evaluation of thunderstorm penetration test flights during project Storm Hazards '80
A82-14954
Direct free-flight analysis of aircraft dynamics at high angles of attack
A82-15596
Flight trail of the Aircraft Fatigue Data Analysis System (AFDAS) Mk 2 prototype
[AD-A105270] N82-12066

FLIGHT TIME
Electronic master monitor and advisory display system test and demonstration report
[AD-A105317] N82-13141

FLIGHT TRAINING
Group 1: Scenario design and development issues
N82-13131

FLOQUET THEOREM
Application of the ONERA dynamic stall model to a helicopter blade in forward flight
[ONERA, TP NO. 1981-89] A82-13992

FLOW CHARACTERISTICS
The influence of closed-coupled, rear fuselage mounted nacelles on the design of an advanced high speed wing
N82-13092

FLOW DISTRIBUTION
A large-scale investigation of engine influence on inlet performance at angle-of-attack
[AIAA PAPER 81-2481] A82-13939
Experimental investigation of total pressure loss and airflow distribution for gas turbine combustors
A82-15606
The numerical solution of incompressible turbulent flow over airfoils
N82-12030
Subsonic military aircraft engine intake: An integrated theoretical experiment design
N82-13073
Model testing techniques for measuring inlet drag
N82-13084
The role and implementation of different nacelle/engine simulation concepts for wind-tunnel testing in research and development work on transport aircraft
N82-13086
Numerical analysis of the scramjet-inlet flow field by using two-dimensional Navier-Stokes equations
[NASA-TP-1940] N82-13142

FLOW EQUATIONS
Prediction and measurement of time-variant, three-dimensional flows in military aircraft intakes
N82-13069

FLOW MEASUREMENT
Prediction and measurement of time-variant, three-dimensional flows in military aircraft intakes
N82-13069
Prop-fan integration at cruise speeds
N82-13097

FLOW THEORY
Prop-fan integration at cruise speeds
N82-13097

FLUIDIC CIRCUITS
A dual input actuator for fluidic backup flight control
A82-13088

FLUTTER
Trim tab excitation system for the BAe 146
A82-14363
Experimental and analytical studies of advanced air cushion landing systems
[NASA-CR-3476] N82-12065

Design for active and passive flutter suppression and gust alleviation
[NASA-CR-3482] N82-13147
FLUTTER ANALYSIS
Wing/store flutter - An active adaptive control application A82-13122
Flight vibration optimization via conformal mapping A82-13975
Aeroelasticity matters: Some reflections on two decades of testing in the NASA Langley transonic dynamics tunnel
[NASA-TM-83210] N82-12041
Computational methods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164983] N82-12080
Interactive aircraft flight control and aeroelastic stabilization --- forward swept wing flight vehicles
[NASA-CR-165036] N82-13150
FLY BY WIRE CONTROL
A dual input actuator for fluidic backup flight control A82-13088
Direct digital drive actuation
[AIAA 81-2298] A82-13505
Reliability analysis of the F-8 digital fly-by-wire system
[NASA-CR-163110] N82-12079
FOAMS
Techniques for modifying airfoils and fairings on aircraft using foam and fiberglass
[AIAA PAPER 81-2445] A82-14383
Formulation and characterization of polyimide resilient foams of various densities for aircraft seating applications
[NASA-CR-167421] N82-12230
FREE FLIGHT TEST APPARATUS
Direct free-flight analysis of aircraft dynamics at high angles of attack A82-15596
FREQUENCY RESPONSE
The use of frequency methods in rotorcraft system identification
[AIAA PAPER 81-2386] A82-14392
FREQUENCY SYNTHESIZERS
High speed microwave phase-locked loops A82-14696
FRICTION DRAG
A review of flight-to-wind tunnel drag correlation
[AIAA PAPER 81-2475] A82-14382
FUEL COMBUSTION
Chemistry of combustion of fuel-water mixtures
[AD-A105401] N82-12178
Effect of fuel-air-ratio nonuniformity on emissions of nitrogen oxides
[NASA-TP-1798] N82-13143
FUEL CONSUMPTION
Darboux points in minimum-fuel aircraft landing problems A82-13077
Fuel efficient flight profiles in an ATC flow management environment A82-13078
An operational model of specific range for microprocessor applications in piston-prop general aviation airplanes
[AIAA 81-2330] A82-13526
Real-time flight management avionics software system
[AIAA 81-2340] A82-13530
Performance assessment of an advanced reheated turbo fan engine
[AIAA PAPER 81-2447] A82-13879
Wing design for light transport aircraft with improved fuel economy A82-14416
The all electric airplane - Its development and logistic support A82-14709
Flight management systems for modern jet aircraft A82-14778
Failure analysis of variable reluctance stepper motor --- in electronic fuel control system on jet engine A82-14792
Airplane performance sensitivities to lateral and vertical profiles A82-15846
CT7 - GE attacks commuter turboprop market A82-15950
FUEL TESTS
Quality optimization and unification of aviation gasolines A82-15721
FUEL-AIR RATIO
Effect of fuel-air-ratio nonuniformity on emissions of nitrogen oxides
[NASA-TP-1798] N82-13143
FULL SCALE TESTS
F/A-18 roll rate improvement program A82-14939
FUSELAGES
A recursive time domain analysis of distributed line grid networks with application to the LTA/EMP problem --- Lightning Threat Analysis A82-14761
Some RAE research on shielded and unshielded fuselage mounted air intakes at subsonic and supersonic speeds N82-13066
The influence of closed-coupled, rear fuselage mounted nacelles on the design of an advanced high speed wing N82-13092
Aerodynamic aspects of a high bypass ratio engine installation on a fuselage afterbody N82-13093

G

GAME THEORY
Air-to-air combat analysis - Review of differential-gaming approaches A82-13115
GARMENTS
Evaluation of a selected group of anti-exposure garment configurations for their effects on the operational performance and survival of Naval aircrewmen A82-14972
GAS FLOW
Divergence of a sweptforward wing A82-13560
GAS TURBINE ENGINES
Creep and aero gas turbine design A82-12987
Study of the load-carrying capacity of aviation gas-turbine engine impellers under low-cycle loading at normal and high temperatures A82-15482
Experimental investigation of total pressure loss and airflow distribution for gas turbine combustors A82-15636
'In situ' composites for jet propulsion and stationary gas turbine applications A82-15824
Progress in protective coatings for aircraft gas turbines: A Review of NASA sponsored research
[NASA-TM-82740] N82-12216
GASOLINE
Quality optimization and unification of aviation gasolines A82-15721
GEARS
Vibration test procedures for accessory angle drive gearboxes on Atar 09C engines --- turbojet engines
[AD-A105269] N82-12076
GENERAL AVIATION AIRCRAFT
An operational model of specific range for microprocessor applications in piston-prop general aviation airplanes
[AIAA 81-2330] A82-13526
Emergency in-flight egress for general aviation aircraft A82-14953
Design study report for General Aviation Loran-C receiver
[AD-A104921] N82-12062
NASA research in aircraft propulsion
[NASA-TM-82771] N82-13146
GLASS FIBER REINFORCED PLASTICS
Techniques for modifying airfoils and fairings on aircraft using foam and fiberglass
[AIAA PAPER 81-2445] A82-14383

GLIDING
  A look at the Hoffman Triangular parachute - The first successful glidable parachute A82-14966
GLOBAL POSITIONING SYSTEM
  Navstar Global Positioning System flight test program overview [AIAA PAPER 81-2350] A82-13956
  Weapon delivery system using GPS A82-14711
  Passive terrain following using stored map and global positioning system A82-14772
GOVERNMENT/INDUSTRY RELATIONS
  Government testing [AIAA PAPER 81-2443] A82-13877
  The payoff from U.S. investment in aeronautical research and development A82-14793
GRAPHITE-EPOXY COMPOSITES
  In-service inspection methods for graphite-epoxy structures on commercial transport aircraft [NASA-CR-165746] N82-12142
GROUND BASED CONTROL
  AN/TPN-25 and AN/GPN-22 precision approach radars A82-14856
GROUND EFFECT (AERODYNAMICS)
  Jet V/STOL wind-tunnel simulation and groundplane effects A82-13973
GROUND HANDLING
  C-5A unsurfaced taxi and off-load demonstrations [AIAA PAPER 81-2439] A82-13875
GROUND SPEED
  The use of groundspeed, in a wind shear and the flight evaluation of a radar-altimeter-based system for the measurement of groundspeed [AD-A104758] N82-12060
GROUND TESTS
  Overview of flight and ground testing with emphasis on the wind tunnel [AIAA PAPER 81-2474] A82-13928
  Comparison of low-speed handling qualities in ground-based and in-flight simulator tests [AIAA PAPER 81-2478] A82-13936
GUIDANCE (MOTION)
  Experience with flight test trajectory guidance [AIAA PAPER 81-2504] A82-14379
GUIDANCE SENSORS
  Redundancy management of skewed and dispersed inertial sensors [AIAA 81-2296] A82-13503
  Development and laboratory test of an integrated sensory system /ISS/ for advanced aircraft [AIAA 81-2297] A82-13504
  Navigation for helicopters by multiple use of inertial sensors A82-14713
GUIDE VANES
  Effect of a part span variable inlet guide vane on TF34 fan performance [NASA-CR-165458] N82-12075
  Transonic flows in an air inlet with large incidence and the effect of a blowing trap N82-13071
GUNS (ORDNANCE)
  Evaluation of advanced air-to-air gunnery fire control systems A82-14750
GUST ALLEVIATORS
  Design for active and passive flutter suppression and gust alleviation [NASA-CR-3482] N82-13147

H

HALL EFFECT
  Effect of vacuum exhaust pressure on the performance of MHD ducts at high B-field [NASA-TM-82750] N82-13908
HARMONIC EXCITATION
  Structural dynamics: Modified calculations --- natural and harmonically excited vibrations of modified structures; increased computation efficiency [BMVG-FBWT-81-1] N82-13457
HARNESSES
  'Little people' problem /MA-2 torso harness/ A82-14958
  A new safety harness for mobile aircrew A82-14963
HARRIER AIRCRAFT
  Commentary on facilities used in the development of a Sea Harrier all weather operations capability [AIAA PAPER 81-2407] A82-13892
  AV-8B technical update - Leading edge root extension development A82-14940
  A real time Pegasus propulsion system model for VSTOL piloted simulation evaluation [NASA-TM-82770] N82-13144
HAZARDS
  Investigation of the structural degradation and personnel hazards resulting from helicopter composite structures exposed to fires and/or explosions [AD-A104757] N82-12057
HEAD-UP DISPLAYS
  Applications of head-up displays in commercial transport aircraft [AIAA 81-2300] A82-13506
  The LANTIRN wide field-of-view raster Head-Up Display --- Low Altitude Navigation and Targeting IR for Night A82-14825
  Head up displays N82-13052
HEAT RESISTANT ALLOYS
  Attack on superalloys by chemical and electrolytic processes A82-14365
  'In situ' composites for jet propulsion and stationary gas turbine applications A82-15824
HEAVY LIFT HELICOPTERS
  Heavy lift helicopters - A national technology opportunity A82-13241
HELICOPTER CONTROL
  The design of exact nonlinear model followers --- with application to trajectory autopilot for helicopter A82-13125
  Helicopter IFR - Past, present and future and future A82-13245
  Navigation for helicopters by multiple use of inertial sensors A82-14713
  Application of multiple model estimation techniques to a recursive terrain height correlation system A82-14768
  Experimental evaluation of a perspective tunnel display for three-dimensional helicopter approaches A82-15847
HELICOPTER DESIGN
  The Agusta A129 A82-13237
  Public service helicopters - Is the grass greener on the other side of the fence A82-13238
  Fatigue methodology - A technical management system for helicopter safety and durability A82-13240
  Heavy lift helicopters - A national technology opportunity A82-13241
  The FAA's proposed helicopter certification rules A82-13242
  Wire strike protection A82-13246
  Design of a crashworthy crew seat for the Boeing Vertol Chinook helicopter A82-14975
  How the helicopter cockpit designer uses digital avionics N82-13039
  Integration of controls and displays in US Army helicopter cockpits N82-13053
HELICOPTER ENGINES
  The protection of gas turbine blades - A platinum aluminide diffusion coating A82-14364
HELICOPTER PERFORMANCE
  The Agusta A129 A82-13237

Heavy lift helicopters - A national technology opportunity A82-13241
Helicopter icing A82-13243
Planning a helicopter flight test program [AIAA PAPER 81-2381] A82-13881
Flight vibration optimization via conformal mapping A82-13975
Progress report - CH-47 modernization program A82-14930
Safety of helicopters in flight --- Russian book A82-14946
System identification helicopter parameters. Determination from flight tests, phase 2 [BMVG-FBWT-80-12] N82-13137

HELICOPTER PROPELLER DRIVE
In-flight computation of helicopter transmission fatigue life expenditure [AIAA PAPER 81-2434] A82-13872

HELICOPTER TAIL ROTORS
An analysis of civil aviation propeller-to-person accidents: 1965-1979 [AD-A105365] N82-12053

HELICOPTER WAKES
Experimental and analytical studies of a model helicopter rotor in hover [NASA-TM-81232] N82-12042

HELICOPTERS
Instrumentation to determine the suitability of RNAV systems for helicopter navigation in the national airspace system /NAS/ [AIAA PAPER 81-2514] A82-13911
Flight testing the suspended maneuvering system --- helicopter firefighting and rescue techniques [AIAA PAPER 81-2498] A82-13922
HASEP - Survival from crashed Navy helicopters A82-14977
Investigation of the structural degradation and personnel hazards resulting from helicopter composite structures exposed to fires and/or explosions [AD-A104757] N82-12057
Flight evaluation of LORAN-C as a helicopter navigation aid in the Baltimore Canyon oil exploration area [AD-A105260] N82-12059
Electronic Master Monitor and Advisory Display System (EMMADS) [AD-A105082] N82-12067
A vapour cycle cabin cooling system for the Sea King MK.50 helicopter [AD-A105211] N82-12069
Experimental investigation of a helmet mounted sight/display for helicopter N82-13060
Helicopter reliability and maintainability trends during development and production [AD-A105775] N82-13136

HELMET MOUNTED DISPLAYS
Head up displays N82-13052
Experimental investigation of a helmet mounted sight/display for helicopter N82-13060
Use of a helmet-mounted matrix display for presenting energy-maneuverability information during simulated close combat N82-13061

HIGH PRESSURE
The operational characteristics of turbojets, giving particular attention to the cooled high-pressure turbine A82-14414

HIGH VOLTAGES
Computer modeling of an aircraft HVDC electrical system A82-14819
High voltage/high power for airborne applications A82-15918

HOMING DEVICES
A VHF homing system with VHF radiotelephony for area-representative strip-survey flights conducted, as part of combined forest inventories, with light aircraft carrying 70 mm and 35 mm cameras A82-15748

HOT SURFACES
Development and testing of dry chemicals in advanced extinguishing systems for jet engine nacelle fires [NASA-CR-165011] N82-13186

HOVERING
Application of the ONERA dynamic stall model to a helicopter blade in forward flight [ONERA, TP NO. 1981-89] A82-13992
Hover tests of the XV-15 Tilt Rotor Research Aircraft [AIAA PAPER 81-2501] A82-14386
Experimental and analytical studies of a model helicopter rotor in hover [NASA-TM-81232] N82-12042

HUGHES AIRCRAFT
Pave Hover Flight Test Program [AIAA PAPER 81-2492] A82-14380

HUMAN FACTORS ENGINEERING
Digital avionics - What a pilot expects to see [AIAA 81-2217] A82-13455
Electronic flight deck displays for transport aircraft [AIAA 81-2264] A82-13483
F/A-18 'Hornet' - One man operability [AIAA 81-2266] A82-13484
'Little people' problem /MA-2 torso harness/ A82-14956
Computer image generation for flight simulation A82-15599
Computer Air Carrier Symposium [AD-A104894] N82-12054
Color CRT displays for the cockpit N82-13051
Using voice control onboard combat aircraft N82-13056
Experimental investigation of a helmet mounted sight/display for helicopter N82-13060
Tanker avionics and aircrew complement evaluation N82-13063
F/A 18 Hornet crew station N82-13064
Paven aircraft filter-absorber --- agricultural aircraft [AD-A058962] N82-13139

HYDRAULIC CONTROL
Will power-by-wire replace power-by-hydraulics A82-14707

HYDRAULIC FLUIDS
Efficient use of working fluids in aviation hydraulic systems A82-15724

HYDROCARBON FUEL PRODUCTION
Development of catalytic systems for the conversion of syngas to jet fuel and diesel fuel and higher alcohols [DE82-000067] N82-12255

HYDROCARBON FUELS
Development and testing of dry chemicals in advanced extinguishing systems for jet engine nacelle fires [NASA-CR-165011] N82-13186

I

ICE FORMATION
Helicopter icing A82-13243

IDENTIFYING
An update of an integrated CNI system - TIES --- Communication, Navigation, and Identification provided by Tactical Information Exchange System [AIAA 81-2292] A82-13500

IMAGE PROCESSING
Computational considerations for fusion in target identification systems --- multisensor correlation A82-14735
Algorithms for an adaptive dynamic window in electronic map systems A82-14769
Inverse SAR and its application to aircraft classification A82-14871

IMAGING TECHNIQUES
Weather impact on low-altitude imaging infrared sensors in Europe - An availability model A82-14779

Head up displays
N82-13052

IMPACT DAMAGE
Wire strike protection
A82-13246

IMPACT RESISTANCE
The load-carrying behavior of a trapezoidal aluminum-alloy supporting element, subjected to a compressive stress, in the postbuckling region
A82-14416

IMPACT TESTS
Test and evaluation of improved aircrew restraint systems
A82-14974

IN-FLIGHT MONITORING
Computer-in-control selection logic for a triplex digital flight control system
[AIAA 81-2236] A82-13465
In-flight computation of helicopter transmission fatigue life expenditure
[AIAA PAPER 81-2434] A82-13872
Direct strike lightning measurement system --- for aircraft
[AIAA PAPER 81-2513] A82-13910
Improved techniques for the calibration and measurement of in-flight loads
[AIAA PAPER 81-2502] A82-13924
Flight trail of the Aircraft Fatigue Data Analysis System (AFDAS) Mk 2 prototype
[AD-A105270] N82-12066
Electronic Master Monitor and Advisory Display System (EMMADS)
[AD-A105082] N82-12067

INCIDENCE
Transonic flows in an air inlet with large incidence and the effect of a blowing trap
N82-13071

INCOMPRESSIBLE FLOW
The numerical solution of incompressible turbulent flow over airfoils
N82-12030

INDEXES (DOCUMENTATION)
Index of National Aviation Facilities Experimental Center technical reports 1972 - 1977
[AD-A104759] N82-12056

INERTIAL NAVIGATION
Fault detection for two physically separated, communicating inertial measurement units
A82-13142
The use of separated multifunction inertial sensors for flight control
[AIAA 81-2295] A82-13502
Navigation for helicopters by multiple use of inertial sensors
A82-14713
Evaluating sources of error in EAR/GEANS navigation using a Kalman postprocessor --- Electronically Agile Radar/Gimbaled Electrically suspended gyro Airborne Navigation System
A82-14739

INERTIAL PLATFORMS
A failure detection and isolation system for tactical aircraft with separated IMUs
A82-14684

INERTIAL REFERENCE SYSTEMS
The use of separated multifunction inertial sensors for flight control
[AIAA 81-2295] A82-13502
Strapdown inertial reference systems performance analysis
A82-14682

INFLATING
Further test results of parachutes with automatic inflation modulation /A.I.M./
A82-14965

INFORMATION FLOW
Higher order Information Transfer Systems are coming
[AIAA 81-2317] A82-13517

INFORMATION SYSTEMS
An update of an integrated CNI system - TIES --- Communication, Navigation, and Identification provided by Tactical Information Exchange System
[AIAA 81-2292] A82-13500
Advanced weapon systems - Integration technology --- Digital Avionic Information System
[AIAA 81-2213] A82-13533
Information technology and its impact on test and evaluation at the Naval Air Test Center
[AIAA PAPER 81-2396] A82-13894
Implementing the DAIS executive --- Digital Avionics Information System software feasibility for aircraft systems
A82-14814

INFRARED DETECTORS
Collection and simulation of spatial infrared signatures of military jet aircraft
[AIAA PAPER 81-2494] A82-13921

INFRARED IMAGERY
Weather impact on low-altitude imaging infrared sensors in Europe - An availability model
A82-14779
The LANTIRN wide field-of-view raster Head-Up Display --- Low Altitude Navigation and Targeting IR for Night
A82-14825

INITIATORS (EXPLOSIVES)
A ballistic design model for initiators for aircraft personnel escape systems
A82-14984
Analytical and experimental characterization of the JAU-14/A cartridge actuated initiator for use in aircrew escape system performance evaluation
A82-14985

INLET AIRFRAME CONFIGURATIONS
Aerodynamics of Power Plant Installation
[AGARD-CP-301] N82-13065
Performance of highly integrated inlets for supersonic aircraft
N82-13066
Some RAE research on shielded and unshielded fuselage mounted air intakes at subsonic and supersonic speeds
N82-13068
Prediction and measurement of time-variant, three-dimensional flows in military aircraft intakes
N82-13069
Effects of intake geometry on circular pitot intake performance at zero and low forward speeds
N82-13070
The design and development of the Tornado engine air intake
N82-13074
Final report on the FueFo-4 major theme: Interference drag with airframe/engine integration on fighter aircraft
[BMVG-FBWT-79-20] N82-13116

INLET FLOW
A large-scale investigation of engine influence on inlet performance at angle-of-attack
[AIAA PAPER 81-2481] A82-13939
Effect of a part span variable inlet guide vane on TF34 fan performance
[NASA-CR-165458] N82-12075
Prediction and measurement of time-variant, three-dimensional flows in military aircraft intakes
N82-13069
Effects of intake geometry on circular pitot intake performance at zero and low forward speeds
N82-13070
Subsonic military aircraft engine intake: An integrated theoretical experiment design
N82-13073
The design and development of the Tornado engine air intake
N82-13074
An acquisition and analysis system for dynamic tests of air inlets
N82-13082
Model testing techniques for measuring inlet drag
N82-13084
Thrust modulation methods for a subsonic V/STOL aircraft
[NASA-TM-82747] N82-13112
Numerical analysis of the scramjet-inlet flow field by using two-dimensional Navier-Stokes equations
[NASA-TP-1940] N82-13102

INSTALLATION MANUALS
Practical aspects of instrumentation system installation, volume 13
[NASA-TM-84067] N82-13140

INSTALLING
Wind tunnel test and analysis techniques using powered simulators for civil nacelle installation drag assessment
N82-13088
INSTRUMENT COMPENSATION
AFFTC standard airspeed calibration procedures
[AD-A104830] N82-12074
INSTRUMENT ERRORS
A concept for a high-accuracy, low-cost accelerometer
A82-14685
INSTRUMENT FLIGHT RULES
Helicopter icing
A82-13243
Helicopter IFR - Past, present and future and future
A82-13245
INSTRUMENT PACKAGES
Planning a helicopter flight test program
[AIAA PAPER 81-2381] A82-13881
INTERACTIVE CONTROL
Advanced display systems for crew stations of tactical aircraft
[AIAA 81-2312] A82-13514
The development and use of a computer-interactive data acquisition and display system in a flight environment
[AIAA PAPER 81-2371] A82-13946
A synthesis technique for highly uncertain and interacting multivariable flight control systems
A82-14627
INTERCEPTION
Comparison between the exact and an approximate feedback solution for medium range interception problems
A82-13106
INTERFACES
Practical aspects of instrumentation system installation, volume 13
[NASA-TM-84067] N82-13140
INTERFERENCE DRAG
Evaluation of an experimental technique to investigate the effects of the engine position on engine/pylon/wing interference
N82-13090
The influence of closed-coupled, rear fuselage mounted nacelles on the design of an advanced high speed wing
N82-13092
Aerodynamic aspects of a high bypass ratio engine installation on a fuselage afterbody
N82-13093
Final report on the FuePo-4 major theme: Interference drag with airframe/engine integration on fighter aircraft
[BMVG-FBWT-79-20] N82-13116
INTERFERENCE LIFT
Evaluation of an experimental technique to investigate the effects of the engine position on engine/pylon/wing interference
N82-13090
INVESTMENTS
The payoff from U.S. investment in aeronautical research and development
A82-14793
A new approach to modeling the cost of ownership for aircraft systems
[AD-A104434] N82-13979
INVISCID FLOW
Aerodynamic aspects of a high bypass ratio engine installation on a fuselage afterbody
N82-13093
A numerical method for studying nacelle-jet-airfoil interaction in inviscid three-dimensional flow
N82-13094
ISOPARAMETRIC FINITE ELEMENTS
A set of finite elements developed for the dynamic computation of composite helicopter blades
[ONERA, TP NO. 1981-87] A82-13990
ITERATIVE SOLUTION
Computational methods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164983] N82-12080

J

J-79 ENGINE
The F-16/79 test program
[AIAA PAPER 81-2414] A82-13855
JAMMERS
Georgia Tech coherent jammer flight test
[AIAA PAPER 81-2452] A82-13898
JET AIRCRAFT
Collection and simulation of spatial infrared signatures of military jet aircraft
[AIAA PAPER 81-2494] A82-13921
Operational evaluation of the new generation of jet transport aircraft
[AIAA PAPER 81-2377] A82-13942
Jet V/STOL wind-tunnel simulation and groundplane effects
A82-13973
Flight management systems for modern jet aircraft
A82-14778
The influence of wind shear and vertical winds on takeoffs and go-arounds
A82-15823
The influence of closed-coupled, rear fuselage mounted nacelles on the design of an advanced high speed wing
N82-13092
JET ENGINE FUELS
Determination and analysis of jet and missile fuel deposits
[AD-A105458] N82-12248
Development of catalytic systems for the conversion of syngas to jet fuel and diesel fuel and higher alcohols
[DE82-000067] N82-12255
JET ENGINES
Failure analysis of variable reluctance stepper motor --- in electronic fuel control system on jet engine
A82-14792
'In situ' composites for jet propulsion and stationary gas turbine applications
A82-15824
Subsonic military aircraft engine intake: An integrated theoretical experiment design
N82-13073
The design and development of the Tornado engine air intake
N82-13074
Integration of advanced exhaust nozzles
N82-13075
Development and testing of dry chemicals in advanced extinguishing systems for jet engine nacelle fires
[NASA-CR-165011] N82-13186
JET EXHAUST
Prediction of subsonic aircraft flows with jet exhaust interactions
N82-13096
JET MIXING FLOW
Investigation of acoustic interactions in jet thrust augmenting ejectors
[AD-A106083] N82-13835
JET THRUST
Performance assessment of an advanced reheated turbo fan engine
[AIAA PAPER 81-2447] A82-13879

K

KALMAN FILTERS
Evaluating sources of error in EAR/GEANS navigation using a Kalman postprocessor --- Electronically Agile Radar/Gimbaled Electrically suspended gyro Airborne Navigation System
A82-14739
Application of multiple model estimation techniques to a recursive terrain height correlation system
A82-14760

L

L-1011 AIRCRAFT
Fault isolation methodology for the L-1011 digital avionic flight control system
[AIAA 81-2223] A82-13458

LAGRANGE MULTIPLIERS
  Mathematical programming in engineering design problems
  A82-15864

LANDING AIDS
  Digital signal processing on a background of rereflections for the international aircraft landing system
  A82-13703

LANDING SIMULATION
  Computer-animated predictive displays for microwave landing approaches
  A82-15816

LASER APPLICATIONS
  Digital detection and processing of laser beacon signals for aircraft collision hazard warning
  [AIAA 81-2328] A82-13525

LASER RANGER/TRACKER
  ATARK laser tracking system
  A82-13016
  Options for GTE precision automated tracking system --- airborne laser tracking system
  A82-13020

LASER TARGET DESIGNATORS
  Electro-optical vector scoring system --- for missile miss distance in fleet training exercises
  [AIAA PAPER 81-2373] A82-13945

LASER TARGETS
  ATARK laser tracking system
  A82-13016

LATERAL CONTROL
  Design and flight test of a lateral-directional command augmentation system
  [AIAA 81-2331] A82-13527
  A cost effective method for the control of roll due to side slip on a low speed aircraft
  [AIAA PAPER 81-2422] A82-13861
  Analysis of a longitudinal pilot-induced oscillation experienced on the approach and landing test of the space shuttle
  [NASA-TM-81366] N82-13149

LATERAL STABILITY
  A cost effective method for the control of roll due to side slip on a low speed aircraft
  [AIAA PAPER 81-2422] A82-13861

LEADING EDGES
  AV-8B technical update - Leading edge root extension development
  A82-14940

LEAR JET AIRCRAFT
  Determining hinge moments and empennage airload parameters from flight data for Learjet airplanes
  A82-13120
  The all composite Lear Fan 2100
  A82-14936
  Acceptance testing of the Calspan variable stability Learjet
  A82-14937

LEAST SQUARES METHOD
  Performance estimation from non-steady manoeuvres
  [AIAA PAPER 81-2424] A82-13863

LIFE CYCLE COSTS
  Advanced integrated CNI architectures --- Communications, Navigation and Identification avionics for tactical aircraft and attack helicopter
  A82-14763
  A new approach to modeling the cost of ownership for aircraft systems
  [AD-A104434] N82-13979

LIFE SUPPORT SYSTEMS
  U.S. Navy life support development trends
  A82-14952

LIFT
  A technique to determine lift and drag polars in flight and their application
  [AIAA PAPER 81-2420] A82-13859

LIFT AUGMENTATION
  Progress report - CH-47 modernization program
  A82-14930

LIFT DRAG RATIO
  Development of a lifting parachute to provide self-dispersing capability for an Avco-designed tactical munition
  [AIAA PAPER 81-1926] A82-13962

LIGHT AIRBORNE MULTIPURPOSE SYSTEM
  Light Airborne Multi-Purpose System
  A82-13244

LIGHT AIRCRAFT
  Wing design for light transport aircraft with improved fuel economy
  A82-14416

LIGHTNING
  Thunderstorm hazards flight research - Program overview
  [AIAA PAPER 81-2412] A82-13853
  Direct strike lightning measurement system --- for aircraft
  [AIAA PAPER 81-2513] A82-13910
  A recursive time domain analysis of distributed line grid networks with application to the LTA/EMP problem --- Lightning Threat Analysis
  A82-14761
  Investigation of severe lightning strike incidents to two USAF F-106A aircraft
  [NASA-CR-165794] N82-12052

LIGHTNING SUPPRESSION
  Assessment methodology of the lightning threat to advanced aircraft
  A82-14759

LINE OF SIGHT
  Experimental investigation of a helmet mounted sight/display for helicopter
  N82-13060

LINEAR PROGRAMMING
  Mathematical programming in engineering design problems
  A82-15864

LINEAR SYSTEMS
  Computational methods of robust controller design for aerodynamic flutter suppression
  [NASA-CR-164983] N82-12080

LINEARITY
  Effect of vacuum exhaust pressure on the performance of MHD ducts at high B-field
  [NASA-TM-82750] N82-13908

LIQUID CRYSTALS
  An integrated control panel utilizing a programmable varistor-multiplexed dichroic liquid crystal display
  [AIAA 81-2303] A82-13508

LIQUID ROCKET PROPELLANTS
  Determination and analysis of jet and missile fuel deposits
  [AD-A105458] N82-12248

LOAD DISTRIBUTION (FORCES)
  Calculation of wing-body-nacelle interference in subsonic and transonic potential flow
  N82-13095
  Prediction of subsonic aircraft flows with jet exhaust interactions
  N82-13096

LOAD TESTS
  The load-carrying behavior of a trapezoidal aluminum-alloy supporting element, subjected to a compressive stress, in the postbuckling region
  A82-14418
  Vibration test procedures for accessory angle drive gearboxes on Atar 09C engines --- turbojet engines
  [AD-A105269] N82-12076

LOGIC CIRCUITS
  Automatic digital gain ranging --- for flight test telemetry data
  [AIAA PAPER 81-2370] A82-13947

LOGIC DESIGN
  Computer-in-control selection logic for a triplex digital flight control system
  [AIAA 81-2236] A82-13465

LOGISTICS
  The all electric airplane - Its development and logistic support
  A82-14709

LONGITUDINAL CONTROL
  A decoupled control system for improved flight performance in wind shear
  A82-13079
  Enhanced aircraft handling qualities by longitudinal dynamics mode decoupling
  A82-14826

LONGITUDINAL STABILITY
  Analysis of a longitudinal pilot-induced oscillation experienced on the approach and landing test of the space shuttle
  [NASA-TM-81366] N82-13149

LORAN C
A Loran-C prototype navigation receiver for general aviation
[AIAA 81-2329] A82-13532
Flight evaluation of LORAN-C as a helicopter navigation aid in the Baltimore Canyon oil exploration area
[AD-A105260] N82-12059
Design study report for General Aviation Loran-C receiver
[AD-A104921] N82-12062
LOW ALTITUDE
Application of multiple model estimation techniques to a recursive terrain height correlation system
A82-14768
The LANTIRN wide field-of-view raster Head-Up Display --- Low Altitude Navigation and Targeting IR for Night
A82-14025
LOW COST
Low cost programmable multisimulator facility
[AIAA 81-2229] A82-13534
A concept for a high-accuracy, low-cost accelerometer
A82-14685
LOW SPEED
A cost effective method for the control of roll due to side slip on a low speed aircraft
[AIAA PAPER 81-2422] A82-13861
Effects of intake geometry on circular pitot intake performance at zero and low forward speeds
N82-13070
LOW SPEED WIND TUNNELS
A large-scale investigation of engine influence on inlet performance at angle-of-attack
[AIAA PAPER 81-2481] A82-13939
LUBRICATING OILS
Optimization of requirements on the pitting-prevention properties of turbojet-engine oils
A82-15723

M

MACH NUMBER
Studies of air inlets at Reynolds numbers comparable to flight in ONERA's F1 and S1MA wind tunnels
N82-13091
Airframe-propulsion system aerodynamic interference predictions at high transonic Mach numbers including off-design engine airflow effects
N82-13098
MAGNETOHYDRODYNAMICS
Effect of vacuum exhaust pressure on the performance of MHD ducts at high B-field
[NASA-TM-82750] N82-13908
MAGNETS
High speed PMG containment study for VSCF system --- Permanent Magnet Generator for Variable Speed Constant Frequency applications
A82-14791
MAINTAINABILITY
Helicopter reliability and maintainability trends during development and production
[AD-A105775] N82-13136
MAINTENANCE
Practical aspects of instrumentation system installation, volume 13
[NASA-TM-84067] N82-13140
MAN MACHINE SYSTEMS
Avionics implications from weapon system operational utility studies on Manned Air Combat Simulators
[AIAA 81-2230] A82-13463
Have we overlooked the pilot's role in an automated flight deck
[AIAA 81-2262] A82-13481
Avionics systems simulation for the Northrop F/A-18L aircraft
[AIAA 81-2274] A82-13488
Advanced display systems for crew stations of tactical aircraft
[AIAA 81-2312] A82-13514
The integration of control and display concepts for improved pilot situational awareness
A82-13972
The Maneuvering Flight Path Display - A flight trajectory solution display concept
A82-14824
Using voice control onboard combat aircraft
N82-13056
MANAGEMENT INFORMATION SYSTEMS
Conceptual design of an integrated power and avionics information system
A82-14788
MANAGEMENT METHODS
A summary of the Naval Postgraduate School Research Program
[AD-A104112] N82-13975
MANAGEMENT SYSTEMS
Fuel efficient flight profiles in an ATC flow management environment
A82-13078
MANEUVERABILITY
C-5A unsurfaced taxi and off-load demonstrations
[AIAA PAPER 81-2439] A82-13875
Use of a helmet-mounted matrix display for presenting energy-maneuverability information during simulated close combat
N82-13061
Maneuver load control for the reduction of design loads and improvement of the maneuverability of modern fighter aircraft
[BMVG-FBWT-81-2] N82-13130
MAP MATCHING GUIDANCE
Airborne Electronic Map Systems. I - Design
A82-14770
MAPPING
Airborne Electronic Map Systems. I - Design
A82-14770
Airborne Electronic Terrain Map System. II - Applications
A82-14773
MAPS
The electronic terrain map - A new avionics integrator
[AIAA 81-2289] A82-13498
MARKET RESEARCH
Public service helicopters - Is the grass greener on the other side of the fence
A82-13238
MATHEMATICAL MODELS
Digital control for flexible aircraft using reduced order models
A82-13094
Costs of noise nuisance from aircraft
A82-13314
Modeling procedures for handling qualities evaluation of flexible aircraft
A82-13968
Investigation of the structural degradation and personnel hazards resulting from helicopter composite structures exposed to fires and/or explosions
[AD-A104757] N82-12057
The effect of visual information on manual approach and landing
[NLR-MP-80019-U] N82-12064
Subsonic military aircraft engine intake: An integrated theoretical experiment design
N82-13073
A real time Pegasus propulsion system model for VSTOL piloted simulation evaluation
[NASA-TM-82770] N82-13144
A new approach to modeling the cost of ownership for aircraft systems
[AD-A104434] N82-13979
MATHEMATICAL PROGRAMMING
Mathematical programming in engineering design problems
A82-15864
MAXIMUM LIKELIHOOD ESTIMATES
On matching the systems identification technique to the particular application --- in evaluating flight test data
A82-13119
MEASURING INSTRUMENTS
Rotor systems research aircraft /RSRA/ rotor force and moment measurement system
[AIAA PAPER 81-2516] A82-13913
MECHANICAL ENGINEERING
Compilation of abstracts of dissertations theses, and research papers submitted by candidates for degrees, 1 October 1979 - 30 September 1980
[AD-A104124] N82-13974

METAL COATINGS
The protection of gas turbine blades - A platinum aluminide diffusion coating
A82-14364
Progress in protective coatings for aircraft gas turbines: A Review of NASA sponsored research
[NASA-TM-82740] N82-12216
METAL FINISHING
The use of metal finishing in aircraft fuel systems
N82-12077
METAL SHEETS
The technology of sheet-metal stamping in the production of aircraft /2nd revised and enlarged edition/ --- Russian book
A82-14998
METAL WORKING
The technology of sheet-metal stamping in the production of aircraft /2nd revised and enlarged edition/ --- Russian book
A82-14998
METEOROLOGICAL RADAR
Commercial airborne weather radar technology
A82-14868
METEOROLOGICAL RESEARCH AIRCRAFT
Thunderstorm hazards flight research - Program overview
[AIAA PAPER 81-2412] A82-13853
METEOROLOGICAL SERVICES
Columbus, Ohio, Voice response system demonstration and evaluation
[AD-A104750] N82-12304
METEOROLOGY
A summary of the Naval Postgraduate School Research Program
[AD-A104112] N82-13975
METHOD OF CHARACTERISTICS
Three dimensional flow investigation with a method of characteristics in the inlet region and the blade-to-blade channels of supersonic axial compressors
[ESA-TT-637] N82-12078
MICROCOMPUTERS
Lockheed Airborne Data System - Distributed microcomputers provide on-board real-time analysis
[AIAA PAPER 81-2367] A82-13949
MICROPROCESSORS
Digital avionics display processor
[AIAA 81-2311] A82-13513
An operational model of specific range for microprocessor applications in piston-prop general aviation airplanes
[AIAA 81-2330] A82-13526
Flight testing De Havilland Aircraft Limited DASH-8 utilizing onboard data analysis by microprocessor
[AIAA PAPER 81-2507] A82-13907
Application of a microprocessor controlled cockpit display for enhanced pilot control of flight test maneuvers
[AIAA PAPER 81-2510] A82-13908
A multimicroprocessor system for ATCRBS monopulse data processing
A82-14777
Microprocessor flight control application study
A82-14796
MICROWAVE EQUIPMENT
High speed microwave phase-locked loops
A82-14696
MICROWAVE LANDING SYSTEMS
Joint Tactical Microwave landing System /JTMLS/ airborne signal processing
[AIAA 81-2247] A82-13471
Development of an MLS lateral autoland system with automatic path definition
[AIAA PAPER 81-1751] A82-13993
Computer-animated predictive displays for microwave landing approaches
A82-15816
MLS performance assessment, task 4. Volume 1: Evaluation procedures and equipment design
[AD-A105393] N82-12061
MICROWAVE SWITCHING
High speed microwave phase-locked loops
A82-14696
MILITARY AIRCRAFT
Heavy lift helicopters - A national technology opportunity
A82-13241
LHX - An advanced avionics system design
[AIAA 81-2249] A82-13472
Flat panel developments for future military aircraft
[AIAA 81-2302] A82-13507
Fiber-optic immunity to EMI/EMP for military aircraft
[AIAA 81-2339] A82-13529
Recent improvements at the Naval Air Test Center for increased test system flexibility
[AIAA PAPER 81-2392] A82-13888
Collection and simulation of spatial infrared signatures of military jet aircraft
[AIAA PAPER 81-2494] A82-13921
KC-10, flight test program management - The contractor's viewpoint
[AIAA PAPER 81-2380] A82-14384
Future directions in CNI integrated avionics
A82-14720
New advances in signal processing technology for integrated CNI avionics --- Communication, Navigation, and Identification
A82-14762
Applications of covariance analysis simulation to avionics flight testing
A82-14767
Microprocessor flight control application study
A82-14796
Testing of the SJU-5A ejection seat for the F/A-18 /HORNET/ aircraft
A82-14955
Crashworthy military passenger seat development
A82-14976
Electronic flight deck displays for military transport aircraft
N82-13050
MILITARY HELICOPTERS
Light Airborne Multi-Purpose System
A82-13244
Advancing blade concept /ABC/ development test program
[AIAA PAPER 81-2437] A82-13873
Test and evaluation of improved aircrew restraint systems
A82-14974
Integration of controls and displays in US Army helicopter cockpits
N82-13053
MILITARY TECHNOLOGY
The interface of multifunction controls and displays to tomorrow's avionics
[AIAA 81-2290] A82-13499
Radar hostile fire location
A82-14857
MINICOMPUTERS
Low cost programmable multisimulator facility
[AIAA 81-2229] A82-13534
MISS DISTANCE
Electro-optical vector scoring system --- for missile miss distance in fleet training exercises
[AIAA PAPER 81-2373] A82-13945
MISSILE CONTROL
Electro-optical vector scoring system --- for missile miss distance in fleet training exercises
[AIAA PAPER 81-2373] A82-13945
Integrated Flight/Weapon Control design and evaluation
A82-14741
MISSILE LAUNCHERS
A methodology for missile launch envelope display evaluation
A82-14744
MISSILE TESTS
Naval Weapons Center - Test and evaluation in the 1980's
[AIAA PAPER 81-2485] A82-13940
Pressure distributions on three different cruciform aft-tail control surfaces of a wingless missile at Mach 1.60, 2.36, and 3.70. Volume 1: Trapezoidal tail
[NASA-TM-80097] N82-13110
MONITORS
Electronic Master Monitor and Advisory Display System (EMMADS)
[AD-A105082] N82-12067
MONOPULSE RADAR
Performance evaluation of target report extractor in the monopulse ATCRBS --- Air Traffic Control Radar Beacon System
A82-14776

MOVING TARGET INDICATORS
Pave Mover Flight Test Program
[AIAA PAPER 81-2492] A82-14380
Some Italian research for developing new primary ATC radars
A82-14775
Air-to-ground MTI radar using a displaced phase center, phased array
A82-14681
Moving target Detector/Airport Surveillance radar (ASR-7) field evaluation
[AD-A105196] N82-12303
MRCA AIRCRAFT
A technique to determine lift and drag polars in flight and their application
[AIAA PAPER 81-2420] A82-13859
The design and development of the Tornado engine air intake
N82-13074
The subsonic performance of practical military variable area convergent nozzles
N82-13076
MULTIPLEXING
A polled contention multiplex system using MIL-STD-1553 protocol
[AIAA 81-2271] A82-13487
Advanced fiber optic systems for avionics applications
[AIAA 81-2319] A82-13518
Techniques for interfacing multiplex systems
[AD-A101457] N82-13135
MULTIPROCESSING (COMPUTERS)
Lockheed Airborne Data System - Distributed microcomputers provide on-board real-time analysis
[AIAA PAPER 81-2367] A82-13949
A multimicroprocessor system for ATCRBS monopulse data processing
A82-14777

N

NACELLES
Aerodynamics of Power Plant Installation
[AGARD-CP-301] N82-13065
Model testing techniques for measuring inlet drag
N82-13084
The role and implementation of different nacelle/engine simulation concepts for wind-tunnel testing in research and development work on transport aircraft
N82-13086
Wind tunnel tests of powered models: A comparison of two methods of simulating the jets of jet engines
N82-13087
Wind tunnel test and analysis techniques using powered simulators for civil nacelle installation drag assessment
N82-13088
Establishment of an experimental technique to provide accurate measurement of the installed drag of close coupled civil nacelle/airframe configurations, using a full span model with turbine powered engine simulators
N82-13089
Evaluation of an experimental technique to investigate the effects of the engine position on engine/pylon/wing interference
N82-13090
The influence of closed-coupled, rear fuselage mounted nacelles on the design of an advanced high speed wing
N82-13092
Aerodynamic aspects of a high bypass ratio engine installation on a fuselage afterbody
N82-13093
A numerical method for studying nacelle-jet-airfoil interaction in inviscid three-dimensional flow
N82-13094
Airframe-propulsion system aerodynamic interference predictions at high transonic Mach numbers including off-design engine airflow effects
N82-13098
Thrust modulation methods for a subsonic V/STOL aircraft
[NASA-TM-82747] N82-13112
NASA PROGRAMS
Progress in aeronautical research and technology applicable to civil air transports
A82-13974
NAVIER-STOKES EQUATION
Prediction of subsonic aircraft flows with jet exhaust interactions
N82-13096
Numerical analysis of the scramjet-inlet flow field by using two-dimensional Navier-Stokes equations
[NASA-TP-1940] N82-13142
NAVIGATION AIDS
Time-referencing of data in an asynchronous environment --- for fighter aircraft avionics
[AIAA 81-2341] A82-13531
Estimation of the efficiency of radioelectronic flight navigation systems
A82-13701
Flight evaluation of LORAN-C as a helicopter navigation aid in the Baltimore Canyon oil exploration area
[AD-A105260] N82-12059
NAVIGATION INSTRUMENTS
A Loran-C prototype navigation receiver for general aviation
[AIAA 81-2329] A82-13532
Applications of covariance analysis simulation to avionics flight testing
A82-14767
NAVSTAR SATELLITES
Navstar Global Positioning System flight test program overview
[AIAA PAPER 81-2350] A82-13956
Passive terrain following using stored map and global positioning system
A82-14772
NAVY
U.S. Navy life support development trends
A82-14952
HASEP - Survival from crashed Navy helicopters
A82-14977
A summary of the Naval Postgraduate School Research Program
[AD-A104112] N82-13975
NEAR WAKES
Theoretical analysis of wake-induced parachute collapse
[AIAA PAPER 81-1922] A82-13963
NEODYMIUM LASERS
Options for GTE precision automated tracking system --- airborne laser tracking system
A82-13020
NETHERLANDS
Orienting description of air traffic control in the Netherlands
[VTH-LR-285] N82-12063
NETWORK SYNTHESIS
Conceptual design of an integrated power and avionics information system
A82-14788
NEW JERSEY
Flight evaluation of LORAN-C as a helicopter navigation aid in the Baltimore Canyon oil exploration area
[AD-A105260] N82-12059
NIGHT VISION
The TADS/PNVS 'eyes' for the AH-64 attack helicopter
A82-13239
The LANTIRN wide field-of-view raster Head-Up Display --- Low Altitude Navigation and Targeting IR for Night
A82-14825
Experimental investigation of a helmet mounted sight/display for helicopter
N82-13060
NITROGEN OXIDES
Effect of fuel-air-ratio nonuniformity on emissions of nitrogen oxides
[NASA-TP-1798] N82-13143
NOISE POLLUTION
Costs of noise nuisance from aircraft
A82-13314
NOISE PREDICTION (AIRCRAFT)
The FAA's proposed helicopter certification rules
A82-13242

NOISE REDUCTION
  Aircraft absorbers - Promise and practice --- sound attenuation
    A82-14042
  Analysis of integrated fuel-efficient, low-noise procedures in terminal-area operations
    [DE81-029833] N82-13014
NONDESTRUCTIVE TESTS
  In-service inspection methods for graphite-epoxy structures on commercial transport aircraft
    [NASA-CR-165746] N82-12142
NONLINEAR SYSTEMS
  The design of exact nonlinear model followers --- with application to trajectory autopilot for helicopter
    A82-13125
  An approach to robust nonlinear control design --- with illustration of J-85 turbojet engine simulation
    A82-13128
  Application of the concept of dynamic trim control and nonlinear system inverses to automatic control of a vertical attitude takeoff and landing aircraft
    [AIAA 81-2238] A82-13466
  Integrated flight testing based on nonlinear system identification data processing techniques
    [AIAA PAPER 81-2449] A82-14389
NONUNIFORM FLOW
  Effect of fuel-air-ratio nonuniformity on emissions of nitrogen oxides
    [NASA-TP-1798] N82-13143
NOSE INLETS
  Thrust modulation methods for a subsonic V/STOL aircraft
    [NASA-TM-82747] N82-13112
NOZZLE DESIGN
  Integration of advanced exhaust nozzles
    N82-13075
  The subsonic performance of practical military variable area convergent nozzles
    N82-13076
  Advanced exhaust nozzle technology
    N82-13078
NOZZLE EFFICIENCY
  Comparison of different nozzle concepts for a reheated turbofan
    N82-13077
  Advanced exhaust nozzle technology
    N82-13078
NOZZLE GEOMETRY
  The subsonic performance of practical military variable area convergent nozzles
    N82-13076
NOZZLE THRUST COEFFICIENTS
  Thrust modulation methods for a subsonic V/STOL aircraft
    [NASA-TM-82747] N82-13112
NUMERICAL ANALYSIS
  Air-to-air combat analysis - Review of differential-gaming approaches
    A82-13115
NUMERICAL CONTROL
  Parallel processing applied to digital flight control systems - Some perspectives
    A82-14794
  Microprocessor flight control application study
    A82-14796
NUMERICAL FLOW VISUALIZATION
  The numerical solution of incompressible turbulent flow over airfoils
    N82-12030

O

OBLIQUE WINGS
  AD-1 oblique wing aircraft program
    [AIAA PAPER 81-2354] A82-14390
OBSERVABILITY (SYSTEMS)
  The use of observers on relaxed static stability aircraft
    A82-14740
OCEANOGRAPHY
  A summary of the Naval Postgraduate School Research Program
    [AD-A104112] N82-13975
OFFSHORE ENERGY SOURCES
  Flight evaluation of LORAN-C as a helicopter navigation aid in the Baltimore Canyon oil exploration area
    [AD-A105260] N82-12059
OIL ADDITIVES
  Optimization of requirements on the pitting-prevention properties of turbojet-engine oils
    A82-15723
OMEGA NAVIGATION SYSTEM
  Updated station deselection procedures to support automatic Omega receiver operation
    A82-14712
ONBOARD DATA PROCESSING
  Flight testing De Havilland Aircraft Limited DASH-8 utilizing onboard data analysis by microprocessor
    [AIAA PAPER 81-2507] A82-13907
  Lockheed Airborne Data System - Distributed microcomputers provide on-board real-time analysis
    [AIAA PAPER 81-2367] A82-13949
ONBOARD EQUIPMENT
  Rotor systems research aircraft /RSRA/ rotor force and moment measurement system
    [AIAA PAPER 81-2516] A82-13913
  Design study report for General Aviation Loran-C receiver
    [AD-A104921] N82-12062
OPERATING COSTS
  A new approach to modeling the cost of ownership for aircraft systems
    [AD-A104434] N82-13979
OPERATING TEMPERATURE
  The operational characteristics of turbojets, giving particular attention to the cooled high-pressure turbine
    A82-14414
OPTICAL COMMUNICATION
  Light-guided information distribution systems
    [AIAA 81-2320] A82-13519
OPTICAL RADAR
  Options for GTS precision automated tracking system --- airborne laser tracking system
    A82-13020
OPTICAL TRACKING
  ATARS laser tracking system
    A82-13016
  Experimental investigation of a helmet mounted sight/display for helicopter
    N82-13060
OPTICAL WAVEGUIDES
  Light-guided information distribution systems
    [AIAA 81-2320] A82-13519
OPTIMAL CONTROL
  Digital control for flexible aircraft using reduced order models
    A82-13094
  On-line optimization of aircraft altitude and flight path angle dynamics
    A82-13107
  Application of singular perturbation theory
    N82-12050
  Computational methods of robust controller design for aerodynamic flutter suppression
    [NASA-CR-164983] N82-12080
OPTIMIZATION
  Flight vibration optimization via conformal mapping
    A82-13975
ORIFICE FLOW
  Experimental investigation of total pressure loss and airflow distribution for gas turbine combustors
    A82-15606
OSCILLATIONS
  Analysis of a longitudinal pilot-induced oscillation experienced on the approach and landing test of the space shuttle
    [NASA-TM-81366] N82-13149

P

PANEL METHOD (FLUID DYNAMICS)
  A numerical method for studying nacelle-jet-airfoil interaction in inviscid three-dimensional flow
    N82-13094

PARABOLIC ANTENNAS
Prediction and performance of radome-covered reflector antennas A82-15311

PARABOLIC REFLECTORS
Prediction and performance of radome-covered reflector antennas A82-15311

PARACHUTE DESCENT
Theoretical analysis of wake-induced parachute collapse [AIAA PAPER 81-1922] A82-13963
Escape systems decelerator technology [AIAA PAPER 81-1913] A82-13966
Automatic parachute releasers for premeditated parachuting A82-14960

PARACHUTES
The Air Force Flight Test Center - Utah Test and Training Range in the 1980's [AIAA PAPER 81-2487] A82-13916
Development of a lifting parachute to provide self-dispersing capability for an Avco-designed tactical munition [AIAA PAPER 81-1928] A82-13962
The history of the development of the GQ aeroconical parachute - 1971-1980 A82-14961
Further test results of parachutes with automatic inflation modulation /A.I.M./ A82-14965
A look at the Hoffman Triangular parachute - The first successful glidable parachute A82-14966
Post ejection survival A82-14981

PARALLEL PROCESSING (COMPUTERS)
Parallel processing applied to digital flight control systems - Some perspectives A82-14794

PARAMETER IDENTIFICATION
On matching the systems identification technique to the particular application --- in evaluating flight test data A82-13119
Determining hinge moments and empennage airload parameters from flight data for Learjet airplanes A82-13120
Computational considerations for fusion in target identification systems --- multisensor correlation A82-14735
The agile transversal filter - A flexible building block for ICNIA --- Integrated Communications, Navigation and Identification Avionics A82-14765
Application of multiple model estimation techniques to a recursive terrain height correlation system A82-14768
System identification helicopter parameters. Determination from flight tests, phase 2 [BMVG-FBWT-80-12] N82-13137

PASSENGER AIRCRAFT
Flight testing De Havilland Aircraft Limited DASH-8 utilizing onboard data analysis by microprocessor [AIAA PAPER 81-2507] A82-13907
Two at a time - Flight test plans for the new Boeing airliners [AIAA PAPER 81-2378] A82-13941
CT7 - GE attacks commuter turboprop market A82-15950
Computer Air Carrier Symposium [AD-A104894] N82-12054

PAVEMENTS
Measured pavement response to transient aircraft loadings N82-13442

PERFORMANCE PREDICTION
Performance estimation from non-steady manoeuvres [AIAA PAPER 81-2424] A82-13863
Comparison of wind tunnel and theoretical aeroelastic predictions with flight measured airloads for the B-1 aircraft [AIAA PAPER 81-2387] A82-14393
Strapdown inertial reference systems performance analysis A82-14682
Experimental and analytical studies of advanced air cushion landing systems [NASA-CR-3476] N82-12065
Simulator certification methods and the vertical motion simulator [NASA-CR-166252] N82-12082

PERFORMANCE TESTS
A decoupled control system for improved flight performance in wind shear A82-13079
Helicopter icing A82-13243
C-5A unsurfaced taxi and off-load demonstrations [AIAA PAPER 81-2439] A82-13875
Performance assessment of an advanced reheated turbo fan engine [AIAA PAPER 81-2447] A82-13879
Planning a helicopter flight test program [AIAA PAPER 81-2381] A82-13881
The Air Force Flight Test Center - Utah Test and Training Range in the 1980's [AIAA PAPER 81-2487] A82-13916
A unique integrated flight testing facility for advanced control/display research [AIAA PAPER 81-2490] A82-13919
F/A-18 Flight Test program overview - 1 September 1981 [AIAA PAPER 81-2351] A82-13955
Development of a lifting parachute to provide self-dispersing capability for an Avco-designed tactical munition [AIAA PAPER 81-1928] A82-13962
Theoretical analysis of wake-induced parachute collapse [AIAA PAPER 81-1922] A82-13963
Testing capabilities of the 3246th Test Wing [AIAA PAPER 81-2484] A82-14387
Advanced fighter technology integration AFTI/F-16 test program overview [AIAA PAPER 81-2353] A82-14398
A concept for a high-accuracy, low-cost accelerometer A82-14685
Testing of the SJU-5A ejection seat for the F/A-18 /HORNET/ aircraft A82-14955
Test and evaluation of improved aircrew restraint systems A82-14974
Performance assessment of the ACES-II ejection seat-A-10 configuration A82-14980
Analytical and experimental characterization of the JAU-14/A cartridge actuated initiator for use in aircrew escape system performance evaluation A82-14985

PERTURBATION THEORY
Comparison between the exact and an approximate feedback solution for medium range interception problems A82-13106
Application of singular perturbation theory N82-12050
Computational methods of robust controller design for aerodynamic flutter suppression [NASA-CR-164983] N82-12080

PHASE LOCKED SYSTEMS
High speed microwave phase-locked loops A82-14696

PHASE TRANSFORMATIONS
'In situ' composites for jet propulsion and stationary gas turbine applications A82-15824

PHASED ARRAYS
Using phased array radar for data communications A82-14725
Air-to-ground MTI radar using a displaced phase center, phased array A82-14881

PHOTOMAPPING
Algorithms for an adaptive dynamic window in electronic map systems A82-14769
Airborne Electronic Terrain Map System A82-14771

A VHF homing system with VHF radiotelephony for area-representative strip-survey flights conducted, as part of combined forest inventories, with light aircraft carrying 70 mm and 35 mm cameras
A82-15748

PILOT PERFORMANCE
Have we overlooked the pilot's role in an automated flight deck
[AIAA 81-2262] A82-13481
Evaluation of a selected group of anti-exposure garment configurations for their effects on the operational performance and survival of Naval aircrewmen
A82-14972

PILOT TRAINING
62% manned aircraft demonstrator - Next generation trainer --- cost effective pilot trainer
[AIAA PAPER 81-2519] A82-14385
USNTPS spin program
A82-14931
The USAF Test Pilot School high angle of attack and spin training program
A82-14932
Acceptance testing of the Calspan variable stability Learjet
A82-14937
Computer image generation for flight simulation
A82-15599
Simulator certification methods and the vertical motion simulator
[NASA-CR-166252] N82-12082

PIPER AIRCRAFT
Flight test method for the determination of reciprocating engine cooling requirements
[AIAA PAPER 81-2446] A82-13878

PISTON ENGINES
An operational model of specific range for microprocessor applications in piston-prop general aviation airplanes
[AIAA 81-2330] A82-13526
Flight test method for the determination of reciprocating engine cooling requirements
[AIAA PAPER 81-2446] A82-13878

PITCHING MOMENTS
A calculation method for slender wing-body configurations in supersonic flow at high angles of attack --- nonlinear force and pitching moment characteristics
[BMVG-FBWT-79-15] N82-13115

PITOT TUBES
Effects of intake geometry on circular pitot intake performance at zero and low forward speeds
N82-13070

PITTING
Optimization of requirements on the pitting-prevention properties of turbojet-engine oils
A82-15723

PLANFORMS
Pressure distributions on three different cruciform aft-tail control surfaces of a wingless missile at Mach 1.60, 2.36, and 3.70. Volume 1: Trapezoidal tail
[NASA-TM-80097] N82-13110

PLASMA SPRAYING
Progress in protective coatings for aircraft gas turbines: A Review of NASA sponsored research
[NASA-TM-82740] N82-12216

PLATINUM COMPOUNDS
The protection of gas turbine blades - A platinum aluminide diffusion coating
A82-14364

PLENUM CHAMBERS
Wind tunnel tests of powered models: A comparison of two methods of simulating the jets of jet engines
N82-13087

PNEUMATIC CONTROL
A dual input actuator for fluidic backup flight control
A82-13008

POLES (SUPPORTS)
Computational methods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164983] N82-12080

POLYIMIDE RESINS
Formulation and characterization of polyimide resilient foams of various densities for aircraft seating applications
[NASA-CR-167421] N82-12230

POSITION ERRORS
Updated station deselection procedures to support automatic Omega receiver operation
A82-14712
AN/TPN-25 and AN/GPN-22 precision approach radars
A82-14856

POSTFLIGHT ANALYSIS
Evaluating sources of error in EAR/GEANS navigation using a Kalman postprocessor --- Electronically Agile Radar/Gimballed Electrically suspended gyro Airborne Navigation System
A82-14739

POTENTIAL FLOW
Remarks on the calculation of transonic potential flow by a finite volume method
A82-15835

POWER CONDITIONING
High voltage/high power for airborne applications
A82-15910

POWER EFFICIENCY
Will power-by-wire replace power-by-hydraulics
A82-14707

POWER SUPPLY CIRCUITS
High voltage/high power for airborne applications
A82-15910

POWERED LIFT AIRCRAFT
Powered-lift takeoff performance characteristics determined from flight test of the Quiet Short-haul Research Aircraft /QSRA/
[AIAA PAPER 81-2409] A82-13852

PREDICTION ANALYSIS TECHNIQUES
Prediction of aerodynamic loads on aircrafts with external stores at transonic speeds
N82-13013

PREMIXING
Effect of fuel-air-ratio nonuniformity on emissions of nitrogen oxides
[NASA-TP-1798] N82-13143

PRESSURE DISTRIBUTION
Subcritical and supercritical airfoils for given pressure distribution
N82-12031
Pressure distributions on three different cruciform aft-tail control surfaces of a wingless missile at Mach 1.60, 2.36, and 3.70. Volume 1: Trapezoidal tail
[NASA-TM-80097] N82-13110

PRESSURE DROP
Experimental investigation of total pressure loss and airflow distribution for gas turbine combustors
A82-15606

PRESSURE EFFECTS
Effect of vacuum exhaust pressure on the performance of MHD ducts at high D-field
[NASA-TM-82750] N82-13908

PROCUREMENT MANAGEMENT
Government testing
[AIAA PAPER 81-2443] A82-13877
Flight test concept evolution
[AIAA PAPER 81-2375] A82-13944

PRODUCT DEVELOPMENT
Advanced fighter technology integration AFTI/F-16 test program overview
[AIAA PAPER 81-2353] A82-14398
Electromechanical actuation development program
A82-14705

PRODUCTION ENGINEERING
Quality optimization and unification of aviation gasolines
A82-15721

PROGRAM VERIFICATION (COMPUTERS)
The design and implementation of a canned scenario function for the F-16 dynamic system simulator
A82-14670

PROJECT MANAGEMENT
Organizing and training for innovative flight test management
[AIAA PAPER 81-2416] A82-13856
KC-10, flight test program management - The contractor's viewpoint
[AIAA PAPER 81-2300] A82-14384

PROJECTILES
- Radar hostile fire location A82-14857

PROPELLER BLADES
- An analysis of civil aviation propeller-to-person accidents: 1965-1979 [AD-A105365] N82-12053

PROPELLER EFFICIENCY
- An operational model of specific range for microprocessor applications in piston-prop general aviation airplanes [AIAA 81-2330] A82-13526

PROPELLER FANS
- Prop-fan integration at cruise speeds N82-13097

PROPULSION SYSTEM CONFIGURATIONS
- The role and implementation of different nacelle/engine simulation concepts for wind-tunnel testing in research and development work on transport aircraft N82-13086
- NASA research in aircraft propulsion [NASA-TM-82771] N82-13146

PROPULSION SYSTEM PERFORMANCE
- Advancing blade concept /ABC/ development test program [AIAA PAPER 81-2437] A82-13873
- Recent propulsion system flight tests at the NASA Dryden Flight Research Center [AIAA PAPER 81-2438] A82-13874
- A look inside the Langley 16-foot transonic tunnel: User's guide [NASA-TM-83186] N82-12085

PROTECTIVE COATINGS
- The protection of gas turbine blades - A platinum aluminide diffusion coating A82-14364
- Progress in protective coatings for aircraft gas turbines: A Review of NASA sponsored research [NASA-TM-82740] N82-12216

PULSE COMMUNICATION
- A modular multiplexed digital voice intercommunications system A82-14721

PULSE DOPPLER RADAR
- Detection range analysis of an airborne medium PRF radar A82-14723

PULSED LASERS
- ATARK laser tracking system A82-13016

PYLONS
- Evaluation of an experimental technique to investigate the effects of the engine position on engine/pylon/wing interference N82-13090
- Aerodynamic aspects of a high bypass ratio engine installation on a fuselage afterbody N82-13093

PYROTECHNICS
- Emergency in-flight egress for general aviation aircraft A82-14953
- A ballistic design model for initiators for aircraft personnel escape systems A82-14984

Q

QUALITATIVE ANALYSIS
- Determination and analysis of jet and missile fuel deposits [AD-A105458] N82-12248

QUALITY CONTROL
- Quality optimization and unification of aviation gasolines A82-15721

R

RADAR ANTENNAS
- Air-to-ground MTI radar using a displaced phase center, phased array A82-14881

RADAR APPROACH CONTROL
- AN/TPN-25 and AN/GPN-22 precision approach radars A82-14856

RADAR BEACONS
- Performance evaluation of target report extractor in the monopulse ATCRBS --- Air Traffic Control Radar Beacon System A82-14776
- A multimicroprocessor system for ATCRBS monopulse data processing A82-14777

RADAR DATA
- Using phased array radar for data communications A82-14725
- Extended time radar raw video recording A82-14909

RADAR DETECTION
- Detection range analysis of an airborne medium PRF radar A82-14723
- Radar hostile fire location A82-14857
- Moving target Detector/Airport Surveillance radar (ASR-7) field evaluation [AD-A105195] N82-12303

RADAR EQUIPMENT
- Some Italian research for developing new primary ATC radars A82-14775

RADAR FILTERS
- Some Italian research for developing new primary ATC radars A82-14775

RADAR IMAGERY
- Inverse SAR and its application to aircraft classification A82-14871

RADAR NAVIGATION
- Evaluating sources of error in EAR/GEANS navigation using a Kalman postprocessor --- Electronically Agile Radar/Gimbaled Electrically suspended gyro Airborne Navigation System A82-14739

RADAR RANGE
- Detection range analysis of an airborne medium PRF radar A82-14723

RADAR RECEIVERS
- Performance evaluation of target report extractor in the monopulse ATCRBS --- Air Traffic Control Radar Beacon System A82-14776

RADAR RESOLUTION
- F-15 SAR A82-14938

RADAR SCATTERING
- Commercial airborne weather radar technology A82-14868

RADAR TARGETS
- Detection range analysis of an airborne medium PRF radar A82-14723
- Evaluation of advanced air-to-air gunnery fire control systems A82-14750
- A new approach to radar plot extraction for ATC applications A82-14908

RADAR TRACKING
- Radar hostile fire location A82-14857
- Air-to-ground MTI radar using a displaced phase center, phased array A82-14881
- A new approach to radar plot extraction for ATC applications A82-14908

RADARSCOPES
- A new approach to radar plot extraction for ATC applications A82-14908

RADIATION DISTRIBUTION
- Collection and simulation of spatial infrared signatures of military jet aircraft [AIAA PAPER 81-2494] A82-13921

RADIO ALTIMETERS
- Terrain actuated deployment system --- radar altimeter for man-ejector seat separation A82-14982

The use of groundspeed, in a wind shear and the flight evaluation of a radar-altimeter-based system for the measurement of groundspeed [AD-A104758] N82-12060

RADIO COMMUNICATION
High-accuracy ranging over voice radios for downed aircrew rescue A82-14694
Distributed Time Division Multiple Access /DTDMA/ - A distributed signaling technique for advanced tactical communications A82-14719

RADIO NAVIGATION
Instrumentation to determine the suitability of RNAV systems for helicopter navigation in the national airspace system /NAS/ [AIAA PAPER 81-2514] A82-13911

RADIO RANGE
High-accuracy ranging over voice radios for downed aircrew rescue A82-14694

RADIO RECEIVERS
A Loran-C prototype navigation receiver for general aviation [AIAA 81-2329] A82-13532
New advances in signal processing technology for integrated CNI avionics --- Communication, Navigation, and Identification A82-14762

RADIO TRANSMISSION
Updated station deselection procedures to support automatic Omega receiver operation A82-14712

RADIOTELEPHONES
A VHF homing system with VHF radiotelephony for area-representative strip-survey flights conducted, as part of combined forest inventories, with light aircraft carrying 70 mm and 35 mm cameras A82-15748

RADOMES
Prediction and performance of radome-covered reflector antennas A82-15311

RANDOM ACCESS
Distributed Time Division Multiple Access /DTDMA/ - A distributed signaling technique for advanced tactical communications A82-14719

REACTION KINETICS
Chemistry of combustion of fuel-water mixtures [AD-A105401] N82-12178

REAL TIME OPERATION
Avionics systems simulation for the Northrop F/A-18L aircraft [AIAA 81-2274] A82-13488
Real-time flight management avionics software system [AIAA 81-2340] A82-13530
Recent improvements at the Naval Air Test Center for increased test system flexibility [AIAA PAPER 81-2392] A82-13888
The Advanced Range Instrumentation Aircraft improvement and modernization program [AIAA PAPER 81-2368] A82-13948
Lockheed Airborne Data System - Distributed microcomputers provide on-board real-time analysis [AIAA PAPER 81-2367] A82-13949
General purpose real-time interaction panel for digital simulation --- of flight control systems A82-14831
Group 1: Scenario design and development issues N82-13131
A real time Pegasus propulsion system model for VSTOL piloted simulation evaluation [NASA-TM-82770] N82-13144

RECEIVERS
Design study report for General Aviation Loran-C receiver [AD-A104921] N82-12062

RECORDING INSTRUMENTS
Direct strike lightning measurement system --- for aircraft [AIAA PAPER 81-2513] A82-13910

RECURSIVE FUNCTIONS
A recursive time domain analysis of distributed line grid networks with applications to the LTA/EMP problem --- Lightning Threat Analysis A82-14761

REDUNDANCY
Redundancy management of skewed and dispersed inertial sensors [AIAA 81-2296] A82-13503

REFLECTANCE
Prediction and performance of radome-covered reflector antennas A82-15311

REFUELING
KC-10 flight test program A82-14935

REGRESSION ANALYSIS
On matching the systems identification technique to the particular application --- in evaluating flight test data A82-13119

RELEASING
Automatic parachute releasers for premeditated parachuting A82-14960

RELIABILITY ANALYSIS
Estimation of the efficiency of radioelectronic flight navigation systems A82-13701
Planning a helicopter flight test program [AIAA PAPER 81-2381] A82-13881
Evaluation of a selected group of anti-exposure garment configurations for their effects on the operational performance and survival of Naval aircrewmen A82-14972
Reliability analysis of the F-8 digital fly-by-wire system [NASA-CR-163110] N82-12079

RELIABILITY ENGINEERING
An approach to robust nonlinear control design --- with illustration of J-85 turbojet engine simulation A82-13128
F/A-18A weapon system - 1976 state of the art [AIAA 81-2215] A82-13453
The SIFT computer and its development --- Software Implemented Fault Tolerance for aircraft control [AIAA 81-2278] A82-13490

RELIEF MAPS
Airborne Electronic Terrain Map System A82-14771
Passive terrain following using stored map and global positioning system A82-14772

REMOTE SENSING
Computational considerations for fusion in target identification systems --- multisensor correlation A82-14735

REMOTELY PILOTED VEHICLES
Flight experience with a remotely augmented vehicle flight test technique [AIAA PAPER 81-2417] A82-13857
HiMAT aerodynamic design and flight test experience [AIAA PAPER 81-2433] A82-13871
The development and flight test evaluation of an integrated propulsion control system for the HiMAT research airplane [AIAA PAPER 81-2467] A82-13931
In-flight deflection measurement of the HiMAT aeroelastically tailored wing [AIAA PAPER 81-2450] A82-14301

RESCUE OPERATIONS
Flight testing the suspended maneuvering system --- helicopter firefighting and rescue techniques [AIAA PAPER 81-2498] A82-13922
High-accuracy ranging over voice radios for downed aircrew rescue A82-14694
Rescue at sea A82-14956

RESEARCH
A summary of the Naval Postgraduate School Research Program [AD-A108112] N82-13975

RESEARCH AIRCRAFT
Powered-lift takeoff performance characteristics determined from flight test of the Quiet Short-haul Research Aircraft /QSRA/ [AIAA PAPER 81-2409] A82-13852
Recent propulsion system flight tests at the NASA Dryden Flight Research Center [AIAA PAPER 81-2430] A82-13870

The development and flight test evaluation of an integrated propulsion control system for the HiMAT research airplane
[AIAA PAPER 81-2467] A82-13931

Powered-lift STOL aircraft shipboard operations - A comparison of simulation, land-based and sea trial results for the QSRA --- Quiet Short-haul Research Aircraft
[AIAA PAPER 81-2480] A82-13938

New all-electric-system technology --- electromechanical actuators for aircraft
A82-14710

Ball-Bartoe Jetwing flight tests
A82-14928

RESEARCH AND DEVELOPMENT

Aeronautics in China - An AIAA report --- Book
A82-13150

Civil aviation in China
A82-13600

Advancing blade concept /ABC/ development test program
[AIAA PAPER 81-2437] A82-13873

F/A-18 Flight Test program overview - 1 September 1981
[AIAA PAPER 81-2351] A82-13955

Progress in aeronautical research and technology applicable to civil air transports
A82-13974

Some Italian research for developing new primary ATC radars
A82-14775

The payoff from U.S. investment in aeronautical research and development
A82-14793

U.S. Navy life support development trends
A82-14952

Current aerial cameras
A82-15655

RESEARCH VEHICLES

HiMAT aerodynamic design and flight test experience
[AIAA PAPER 81-2433] A82-13871

RESONANT FREQUENCIES

Structural dynamics: Modified calculations --- natural and harmonically excited vibrations of modified structures; increased computation efficiency
[BMVG-FBWT-81-1] N82-13457

REYNOLDS NUMBER

Studies of air inlets at Reynolds numbers comparable to flight in ONERA's F1 and S1MA wind tunnels
N82-13091

Force and moment, flow-visualization, and boundary-layer tests on a shuttle orbiter model at Mach 6
[NASA-TP-1952] N82-13106

RICCATI EQUATION

Computational methods of robust controller design for aerodynamic flutter suppression
[NASA-CR-164983] N82-12080

RIGID ROTORS

System identification helicopter parameters. Determination from flight tests, phase 2
[BMVG-FBWT-80-12] N82-13137

ROBUSTNESS (MATHEMATICS)

An approach to robust nonlinear control design --- with illustration of J-85 turbojet engine simulation
A82-13128

ROLL

F/A-18 roll rate improvement program
A82-14939

Experimental and analytical studies of advanced air cushion landing systems
[NASA-CR-3476] N82-12065

ROLLING MOMENTS

Effects of aerodynamic coupling on the dynamics of roll aircraft
N82-12070

ROTARY WING AIRCRAFT

Development of a comprehensive analysis for rotorcraft. II - Aircraft model, solution procedure and applications
A82-14407

A new safety harness for mobile aircrew
A82-14963

ROTARY WINGS

Advancing blade concept /ABC/ development test program
[AIAA PAPER 81-2437] A82-13873

A set of finite elements developed for the dynamic computation of composite helicopter blades
[ONERA, TP NO. 1981-87] A82-13990

Application of the ONERA dynamic stall model to a helicopter blade in forward flight
[ONERA, TP NO. 1981-89] A82-13992

Wind-tunnel investigation of the effects of blade tip geometry on the interaction of torsional loads and performance for an articulated helicopter rotor
[NASA-TP-1926] N82-13107

ROTATING GENERATORS

High speed PMG containment study for VSCF system --- Permanent Magnet Generator for Variable Speed Constant Frequency applications
A82-14791

ROTOR AERODYNAMICS

Rotor systems research aircraft /RSRA/ rotor force and moment measurement system
[AIAA PAPER 81-2516] A82-13913

Experimental and analytical studies of a model helicopter rotor in hover
[NASA-TM-81232] N82-12042

German-Argentine experiment: Vertical-rotor wind engine
N82-12640

Wind-tunnel investigation of the effects of blade tip geometry on the interaction of torsional loads and performance for an articulated helicopter rotor
[NASA-TP-1926] N82-13107

An aerodynamic design and the overall stage performance of an air-cooled axial-flow turbine
[NAL-TR-321T] N82-13109

ROTOR BLADES (TURBOMACHINERY)

Study of the load-carrying capacity of aviation gas-turbine engine impellers under low-cycle loading at normal and high temperatures
A82-15482

Thrust modulation methods for a subsonic V/STOL aircraft
[NASA-TM-82747] N82-13112

ROTOR SYSTEMS RESEARCH AIRCRAFT

Rotor systems research aircraft /RSRA/ rotor force and moment measurement system
[AIAA PAPER 81-2516] A82-13913

ROTORCRAFT AIRCRAFT

The use of frequency methods in rotorcraft system identification
[AIAA PAPER 81-2386] A82-14392

ROTORS

High speed PMG containment study for VSCF system --- Permanent Magnet Generator for Variable Speed Constant Frequency applications
A82-14791

RUDDERS

Limited evaluation of an F-14A airplane utilizing an aileron-rudder interconnect control system in the landing configuration
[NASA-TM-81972] N82-13148

RUNWAY CONDITIONS

C-5A unsurfaced taxi and off-load demonstrations
[AIAA PAPER 81-2439] A82-13875

RUNWAYS

Measured pavement response to transient aircraft loadings
N82-13442

S

SAFETY DEVICES

'Little people' problem /MA-2 torso harness/
A82-14958

A new safety harness for mobile aircrew
A82-14963

Test and evaluation of improved aircrew restraint systems
A82-14974

Wind tunnel tests of ejection seat for high dynamic pressure escape
A82-14979

Practical aspects of instrumentation system installation, volume 13
[NASA-TM-84067] N82-13140

SAFETY MANAGEMENT
Fatigue methodology - A technical management system for helicopter safety and durability
A82-13240
SCALE EFFECT
An investigation of F-16 nozzle-afterbody forces at transonic Mach numbers with emphasis on model scale effects
[AD-A104905] N82-12392
SCATTERING COEFFICIENTS
Commercial airborne weather radar technology
A82-14868
SCORING
Electro-optical vector scoring system --- for missile miss distance in fleet training exercises
[AIAA PAPER 81-2373] A82-13945
SEA WATER
Rescue at sea
A82-14956
SEARCH RADAR
Moving target Detector/Airport Surveillance radar (ASR-7) field evaluation
[AD-A105?96] N82-12303
SEATS
Design of a crashworthy crew seat for the Boeing Vertol Chinook helicopter
A82-14975
Crashworthy military passenger seat development
A82-14976
SERVICE LIFE
Operational evaluation of the new generation of jet transport aircraft
[AIAA PAPER 81-2377] A82-13942
Optimization of requirements on the pitting-prevention properties of turbojet-engine oils
A82-15723
SHIELDING
Some RAE research on shielded and unshielded fuselage mounted air intakes at subsonic and supersonic speeds
N82-13068
SHORT HAUL AIRCRAFT
Powered-lift takeoff performance characteristics determined from flight test of the Quiet Short-haul Research Aircraft /QSRA/
[AIAA PAPER 81-2409] A82-13852
SHORT TAKEOFF AIRCRAFT
Flight testing De Havilland Aircraft Limited DASH-8 utilizing onboard data analysis by microprocessor
[AIAA PAPER 81-2507] A82-13907
Powered-lift STOL aircraft shipboard operations - A comparison of simulation, land-based and sea trial results for the QSRA --- Quiet Short-haul Research Aircraft
[AIAA PAPER 81-2480] A82-13938
Ball-Bartoe Jetwing flight tests
A82-14928
Integration of advanced exhaust nozzles
N82-13075
SHROUDED NOZZLES
The subsonic performance of practical military variable area convergent nozzles
N82-13076
SIDESLIP
A cost effective method for the control of roll due to side slip on a low speed aircraft
[AIAA PAPER 81-2422] A82-13861
Effects of aerodynamic coupling on the dynamics of roll aircraft
N82-12070
SIGNAL ANALYSIS
An advanced facility for processing aircraft dynamic test data
[AIAA PAPER 81-2398] A82-14377
SIGNAL DETECTION
Digital detection and processing of laser beacon signals for aircraft collision hazard warning
[AIAA 81-2328] A82-13525
SIGNAL PROCESSING
Joint Tactical Microwave Landing System /JTMLS/ airborne signal processing
[AIAA 81-2247] A82-13471
Digital signal processing on a background of rereflections for the international aircraft landing system
A82-13703
NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volumes 1, 2 & 3
A82-14676
Detection range analysis of an airborne medium PRF radar
A82-14723
New advances in signal processing technology for integrated CNI avionics --- Communication, Navigation, and Identification
A82-14762
Performance evaluation of target report extractor in the monopulse ATCRBS --- Air Traffic Control Radar Beacon System
A82-14776
Radar hostile fire location
A82-14857
F-15 SAR
A82-14938
SIGNAL RECEPTION
Updated station deselection procedures to support automatic Omega receiver operation
A82-14712
SIGNAL TO NOISE RATIOS
Digital signal processing on a background of rereflections for the international aircraft landing system
A82-13703
SIKORSKY AIRCRAFT
Light Airborne Multi-Purpose System
A82-13244
SIMULATION
Wind tunnel tests of powered models: A comparison of two methods of simulating the jets of jet engines
N82-13087
SLENDER BODIES
A calculation method for slender wing-body configurations in supersonic flow at high angles of attack --- nonlinear force and pitching moment characteristics
[BMVG-FBWT-79-15] N82-13115
SLENDER WINGS
A calculation method for slender wing-body configurations in supersonic flow at high angles of attack --- nonlinear force and pitching moment characteristics
[BMVG-FBWT-79-15] N82-13115
SLOTTED WIND TUNNELS
A look inside the Langley 16-foot transonic tunnel: User's guide
[NASA-TM-83186] N82-12085
SOOT
Chemistry of combustion of fuel-water mixtures
[AD-A105401] N82-12178
SOUND PROPAGATION
Impedance modeling of acoustic absorbing materials for aircraft engine applications
A82-14043
SOUND WAVES
Investigation of acoustic interactions in jet thrust augmenting ejectors
[AD-A106083] N82-13835
SPACE FLIGHT TRAINING
Computer image generation for flight simulation
A82-15599
SPACE SHUTTLE ORBITERS
Force and moment, flow-visualization, and boundary-layer tests on a shuttle orbiter model at Mach 6
[NASA-TP-1952] N82-13106
Analysis of a longitudinal pilot-induced oscillation experienced on the approach and landing test of the space shuttle
[NASA-TM-81366] N82-13149
SPACE TRANSPORTATION SYSTEM FLIGHTS
Selected stability and control derivatives from the first Space Shuttle entry
[AIAA PAPER 81-2451] A82-13880
SPACECRAFT CONTROL
Selected stability and control derivatives from the first Space Shuttle entry
[AIAA PAPER 81-2451] A82-13880
SPACECRAFT DESIGN
Research and Technology
[NASA-TM-83221] N82-13043

SPACECRAFT ELECTRONIC EQUIPMENT
NAECON 1981; Proceedings of the National Aerospace and Electronics Conference, Dayton, OH, May 19-21, 1981. Volumes 1, 2 & 3 A82-14676
SPACECRAFT REENTRY
Selected stability and control derivatives from the first Space Shuttle entry [AIAA PAPER 81-2451] A82-13880
SPECTRAL SIGNATURES
Collection and simulation of spatial infrared signatures of military jet aircraft [AIAA PAPER 81-2494] A82-13921
SPECTROSCOPIC ANALYSIS
Determination and analysis of jet and missile fuel deposits [AD-A105456] N82-12248
SPEECH RECOGNITION
Using voice control onboard combat aircraft N82-13056
SPEED CONTROL
Flight investigations of integrated descent rate control systems A82-14929
SPIN TESTS
USNTPS spin program A82-14931
The USAF Test Pilot School high angle of attack and spin training program A82-14932
Navy spin evaluation of the A-7 airplane configured with automatic maneuvering flaps A82-14933
F/A-18A high angle of attack/spin testing A82-14934
SPLINES
Flight testing the nonmetallic spline coupling technology at the Naval Air Test Center [AIAA PAPER 81-2405] A82-13891
SPOILERS
Flight investigations of integrated descent rate control systems A82-14929
STABILITY DERIVATIVES
Selected stability and control derivatives from the first Space Shuttle entry [AIAA PAPER 81-2451] A82-13880
Evaluation and wind tunnel tests of the 4,000 lb (normal-force) pitch/yaw and roll dynamic stability balance systems for measuring direct, cross, and cross-coupling derivatives [AD-A105122] N82-12047
Interactive aircraft flight control and aeroelastic stabilization --- forward swept wing flight vehicles [NASA-CR-165036] N82-13150
STAGNATION FLOW
Effects of intake geometry on circular pitot intake performance at zero and low forward speeds N82-13070
STAGNATION PRESSURE
Pressure distributions on three different cruciform aft-tail control surfaces of a wingless missile at Mach 1.60, 2.36, and 3.70. Volume 1: Trapezoidal tail [NASA-TM-80097] N82-13110
STAMPING
The technology of sheet-metal stamping in the production of aircraft /2nd revised and enlarged edition/ --- Russian book A82-14998
STANDARDIZATION
Aircraft alerting systems standardization study [AIAA 81-2242] A82-13468
A standard control display unit for multi-aircraft application N82-13054
STATIC STABILITY
The use of observers on relaxed static stability aircraft A82-14740
STATISTICAL ANALYSIS
A criterion for determining the causes of wind shear at Punta Raisi Airport, on the basis of statistical data from barograph records A82-15460
STEPPING MOTORS
Failure analysis of variable reluctance stepper motor --- in electronic fuel control system on jet engine A82-14792
STORM DAMAGE
Operational evaluation of thunderstorm penetration test flights during project Storm Hazards '80 A82-14954
STRAIN GAGES
Improved techniques for the calibration and measurement of in-flight loads [AIAA PAPER 81-2502] A82-13924
STRAPDOWN INERTIAL GUIDANCE
The use of separated multifunction inertial sensors for flight control [AIAA 81-2295] A82-13502
Redundancy management of skewed and dispersed inertial sensors [AIAA 81-2296] A82-13503
Strapdown inertial reference systems performance analysis A82-14682
STREAMLINED BODIES
Turbulent wake development behind streamlined bodies N82-13100
STRUCTURAL ANALYSIS
Fatigue methodology - A technical management system for helicopter safety and durability A82-13240
Comparison of wind tunnel and theoretical aeroelastic predictions with flight measured airloads for the B-1 aircraft [AIAA PAPER 81-2387] A82-14393
Development of a comprehensive analysis for rotorcraft. II - Aircraft model, solution procedure and applications A82-14407
STRUCTURAL DESIGN
Status and tracking system for flight test data products [AIAA PAPER 81-2395] A82-14376
Performance assessment of the ACES-II ejection seat-A-10 configuration A82-14980
Mathematical programming in engineering design problems A82-15864
STRUCTURAL RELIABILITY
Design of a crashworthy crew seat for the Boeing Vertol Chinook helicopter A82-14975
Crashworthy military passenger seat development A82-14976
STRUCTURAL VIBRATION
Flight vibration optimization via conformal mapping A82-13975
Analysis of a longitudinal pilot-induced oscillation experienced on the approach and landing test of the space shuttle [NASA-TM-81366] N82-13149
Structural dynamics: Modified calculations --- natural and harmonically excited vibrations of modified structures; increased computation efficiency [BMVG-FBWT-81-1] N82-13457
SUBSONIC FLOW
Calculation of wing-body-nacelle interference in subsonic and transonic potential flow N82-13095
Prediction of subsonic aircraft flows with jet exhaust interactions N82-13096
SUBSONIC SPEED
Thrust modulation methods for a subsonic V/STOL aircraft [NASA-TM-82747] N82-13112
SUBSONIC WIND TUNNELS
Studies of air inlets at Reynolds numbers comparable to flight in ONERA's F1 and S1MA wind tunnels N82-13091
SUPERCRITICAL FLOW
The influence of closed-coupled, rear fuselage mounted nacelles on the design of an advanced high speed wing N82-13092

SUPERCRITICAL WINGS
Subcritical and supercritical airfoils for given pressure distribution
N82-12031
The influence of closed-coupled, rear fuselage mounted nacelles on the design of an advanced high speed wing
N82-13092
SUPERSONIC AIRCRAFT
Aerodynamics of Power Plant Installation
[AGARD-CP-301] N82-13065
Performance of highly integrated inlets for supersonic aircraft
N82-13066
SUPERSONIC COMBUSTION
Effect of vacuum exhaust pressure on the performance of MHD ducts at high B-field
[NASA-TM-82750] N82-13908
SUPERSONIC COMBUSTION RAMJET ENGINES
Numerical analysis of the scramjet-inlet flow field by using two-dimensional Navier-Stokes equations
[NASA-TP-1940] N82-13142
SUPERSONIC FLOW
A calculation method for slender wing-body configurations in supersonic flow at high angles of attack --- nonlinear force and pitching moment characteristics
[BMVG-FBWT-79-15] N82-13115
SUPERSONIC INLETS
Performance of highly integrated inlets for supersonic aircraft
N82-13066
The design and development of the Tornado engine air intake
N82-13074
SUPERSONIC SPEEDS
Pressure distributions on three different cruciform aft-tail control surfaces of a wingless missile at Mach 1.60, 2.36, and 3.70. Volume 1: Trapezoidal tail
[NASA-TM-80097] N82-13110
SUPPORTS
The load-carrying behavior of a trapezoidal aluminum-alloy supporting element, subjected to a compressive stress, in the postbuckling region
A82-14418
SURFACE FINISHING
Attack on superalloys by chemical and electrolytic processes
A82-14365
SURVEILLANCE RADAR
Computational considerations for fusion in target identification systems --- multisensor correlation
A82-14735
SURVIVAL
NASEP - Survival from crashed Navy helicopters
A82-14977
SURVIVAL EQUIPMENT
Evaluation of a selected group of anti-exposure garment configurations for their effects on the operational performance and survival of Naval aircrewmen
A82-14972
SWEPT FORWARD WINGS
Divergence of a sweptforward wing
A82-13560
Interactive aircraft flight control and aeroelastic stabilization --- forward swept wing flight vehicles
[NASA-CR-165036] N82-13150
SWITCHING CIRCUITS
Electronic master monitor and advisory display system test and demonstration report
[AD-A105317] N82-13141
SYMMETRICAL BODIES
Turbulent wake development behind streamlined bodies
N82-13104
SYNTHETIC APERTURE RADAR
Enhanced F-15 air-to-ground flight demonstrations
[AIAA PAPER 81-2413] A82-13054
Pave Mover Flight Test Program
[AIAA PAPER 81-2492] A82-14380
Inverse SAR and its application to aircraft classification
A82-14871
F-15 SAR
A82-14938
SYNTHETIC FUELS
Development of catalytic systems for the conversion of syngas to jet fuel and diesel fuel and higher alcohols
[DE82-000067] N82-12255
SYSTEM EFFECTIVENESS
Aircraft alerting systems standardization study
[AIAA 81-2242] A82-13468
Instrumentation to determine the suitability of RNAV systems for helicopter navigation in the national airspace system /NAS/
[AIAA PAPER 81-2514] A82-13911
Strapdown inertial reference systems performance analysis
A82-14682
SYSTEM FAILURES
Direct digital design method for reconfigurable multivariable control laws for the A-7D Digitac II aircraft
A82-14828
Electronic master monitor and advisory display system test and demonstration report
[AD-A105317] N82-13141
Sensor failure detection system --- for the F100 turbofan engine
[NASA-CR-165515] N82-13145
SYSTEM IDENTIFICATION
Integrated flight testing based on nonlinear system identification data processing techniques
[AIAA PAPER 81-2449] A82-14389
The use of frequency methods in rotorcraft system identification
[AIAA PAPER 81-2386] A82-14392
Future directions in CNI integrated avionics
A82-14720
SYSTEMS ENGINEERING
The design of exact nonlinear model followers --- with application to trajectory autopilot for helicopter
A82-13125
Design and analysis of a digitally controlled integrated flight/fire control system
[AIAA 81-2245] A82-13470
LHX - An advanced avionics system design
[AIAA 81-2249] A82-13472
A polled contention multiplex system using MIL-STD-1553 protocol
[AIAA 81-2271] A82-13487
F/A-18 high authority/high gain digital flight control system development and flight testing
[AIAA PAPER 81-2465] A82-13930
Experience with flight test trajectory guidance
[AIAA PAPER 81-2504] A82-14379
Design for active and passive flutter suppression and gust alleviation
[NASA-CR-3482] N82-13147
SYSTEMS INTEGRATION
Light Airborne Multi-Purpose System
A82-13244
Integrated avionics - Concepts and concerns
[AIAA 81-2211] A82-13452
Design and analysis of a digitally controlled integrated flight/fire control system
[AIAA 81-2245] A82-13470
LHX - An advanced avionics system design
[AIAA 81-2249] A82-13472
An update of an integrated CNI system - TIES --- Communication, Navigation, and Identification provided by Tactical Information Exchange System
[AIAA 81-2292] A82-13500
Development and laboratory test of an integrated sensory system /ISS/ for advanced aircraft
[AIAA 81-2297] A82-13504
An integrated control panel utilizing a programmable varistor-multiplexed dichroic liquid crystal display
[AIAA 81-2303] A82-13508
Higher order Information Transfer Systems are coming
[AIAA 81-2397] A82-13517
Advanced weapon systems - Integration technology --- Digital Avionic Information System
[AIAA 81-2213] A82-13533
F-4 Advanced Avionics Flight Test
[AIAA PAPER 81-2464] A82-13929
The development and flight test evaluation of an integrated propulsion control system for the HiMAT research airplane
[AIAA PAPER 81-2467] A82-13931

Integrated flight testing based on nonlinear system identification data processing techniques [AIAA PAPER 81-2449] A82-14389
Future directions in CNI integrated avionics A82-14720
New advances in signal processing technology for integrated CNI avionics --- Communication, Navigation, and Identification A82-14762
Advanced integrated CNI architectures --- Communications, Navigation and Identification avionics for tactical aircraft and attack helicopter A82-14763
The agile transversal filter - A flexible building block for ICNIA --- Integrated Communications, Navigation and Identification Avionics A82-14765
Conceptual design of an integrated power and avionics information system A82-14788
A look inside the Langley 16-foot transonic tunnel: User's guide [NASA-TM-83186] N82-12085
Integration of advanced exhaust nozzles N82-13075
Techniques for interfacing multiplex systems [AD-A101457] N82-13135

SYSTEMS MANAGEMENT
Redundancy management of skewed and dispersed inertial sensors [AIAA 81-2296] A82-13503

SYSTEMS SIMULATION
Avionics implications from weapon system operational utility studies on Manned Air Combat Simulators [AIAA 81-2230] A82-13463
The design and implementation of a canned scenario function for the F-16 dynamic system simulator A82-14678
Strapdown inertial reference systems performance analysis A82-14682
A failure detection and isolation system for tactical aircraft with separated IMUs A82-14684
The use of observers on relaxed static stability aircraft A82-14740
Computer modeling of an aircraft HVDC electrical system A82-14819
Digital simulation of aircraft electrical generating system by means of Sceptre program A82-14820

T

T-38 AIRCRAFT
A ballistic design model for initiators for aircraft personnel escape systems A82-14584

TABS (CONTROL SURFACES)
Trim tab excitation system for the BAe 146 A82-14363

TACT PROGRAM
Experience with flight test trajectory guidance [AIAA PAPER 81-2504] A82-14379

TAIL ASSEMBLIES
Determining hinge moments and empennage airload parameters from flight data for Learjet airplanes A82-13120
Pressure distributions on three different cruciform aft-tail control surfaces of a wingless missile at Mach 1.60, 2.36, and 3.70. Volume 1: Trapezoidal tail [NASA-TM-80097] N82-13110

TAKEOFF RUNS
The influence of wind shear and vertical winds on takeoffs and go-arounds A82-15823

TANKER AIRCRAFT
KC-10, flight test program management - The contractor's viewpoint [AIAA PAPER 81-2380] A82-14384
Tanker avionics and aircrew complement evaluation N82-13063

TARGET ACQUISITION
The TADS/PNVS 'eyes' for the AH-64 attack helicopter A82-13239

TARGET RECOGNITION
The TADS/PNVS 'eyes' for the AH-64 attack helicopter A82-13239
Computational considerations for fusion in target identification systems --- multisensor correlation A82-14735
The LANTIRN wide field-of-view raster Head-Up Display --- Low Altitude Navigation and Targeting IR for Night A82-14825
A new approach to radar plot extraction for ATC applications A82-14908
F-15 SAR A82-14938

TARGET SIMULATORS
A methodology for missile launch envelope display evaluation A82-14744

TECHNOLOGICAL FORECASTING
The influence of smart computers on the cockpit of the future A82-14743

TECHNOLOGY ASSESSMENT
Aeronautics in China - An AIAA report --- Book A82-13150
Information technology and its impact on test and evaluation at the Naval Air Test Center [AIAA PAPER 81-2396] A82-13894
Progress in aeronautical research and technology applicable to civil air transports A82-13974
A methodology for missile launch envelope display evaluation A82-14744
Progress report - CH-47 modernization program A82-14930
F-15 SAR A82-14938
The technology of sheet-metal stamping in the production of aircraft /2nd revised and enlarged edition/ --- Russian book A82-14998

TECHNOLOGY UTILIZATION
Airborne Electronic Terrain Map System. II - Applications A82-14773

TELEMETRY
Recent improvements at the Naval Air Test Center for increased test system flexibility [AIAA PAPER 81-2392] A82-13888
Automatic digital gain ranging --- for flight test telemetry data [AIAA PAPER 81-2370] A82-13947
The Advanced Range Instrumentation Aircraft improvement and modernization program [AIAA PAPER 81-2368] A82-13948
MLS performance assessment, task 4. Volume 1: Evaluation procedures and equipment design [AD-A105393] N82-12061

TERMINAL CONFIGURED VEHICLE PROGRAM
Have we overlooked the pilot's role in an automated flight deck [AIAA 81-2262] A82-13481
The integration of control and display concepts for improved pilot situational awareness A82-13972

TERMINAL FACILITIES
Technical/operational ATC scenarios for future TMA navigation A82-14774
Analysis of integrated fuel-efficient, low-noise procedures in terminal-area operations [DE81-029833] N82-13018

TERRAIN ANALYSIS
The electronic terrain map - A new avionics integrator [AIAA 81-2289] A82-13498
Application of multiple model estimation techniques to a recursive terrain height correlation system A82-14768
Airborne Electronic Map Systems. I - Design A82-14770
Airborne Electronic Terrain Map System A82-14771

Airborne Electronic Terrain Map System. II - Applications A82-14773

TERRAIN FOLLOWING AIRCRAFT
Passive terrain following using stored map and global positioning system A82-14772

TEST EQUIPMENT
Recent improvements at the Naval Air Test Center for increased test system flexibility [AIAA PAPER 81-2392] A82-13888

TEST FACILITIES
Commentary on facilities used in the development of a Sea Harrier all weather operations capability [AIAA PAPER 81-2407] A82-13892
The Air Force Flight Test Center - Utah Test and Training Range in the 1980's [AIAA PAPER 81-2487] A82-13916
A unique integrated flight testing facility for advanced control/display research [AIAA PAPER 81-2490] A82-13919
Naval Weapons Center - Test and evaluation in the 1980's [AIAA PAPER 81-2485] A82-13940
Two at a time - Flight test plans for the new Boeing airliners [AIAA PAPER 81-2378] A82-13941
Aeroelasticity matters - Some reflections on two decades of testing in the NASA Langley Transonic Dynamics Tunnel A82-13969
Testing capabilities of the 3246th Test Wing [AIAA PAPER 81-2484] A82-14387

TEST PILOTS
USNTPS spin program A82-14931
The USAF Test Pilot School high angle of attack and spin training program A82-14932

TEST RANGES
Naval Weapons Center - Test and evaluation in the 1980's [AIAA PAPER 81-2485] A82-13940

TF-34 ENGINE
Effect of a part span variable inlet guide vane on TF34 fan performance [NASA-CR-165458] N82-12075

THERMAL FATIGUE
Study of the load-carrying capacity of aviation gas-turbine engine impellers under low-cycle loading at normal and high temperatures A82-15482

THERMAL PROTECTION
Progress in protective coatings for aircraft gas turbines: A Review of NASA sponsored research [NASA-TM-82740] N82-12216
Research and Technology [NASA-TM-83221] N82-13043

THERMAL RESISTANCE
Formulation and characterization of polyimide resilient foams of various densities for aircraft seating applications [NASA-CR-167421] N82-12230

THERMAL STABILITY
A concept for a high-accuracy, low-cost accelerometer A82-14685

THESES
Compilation of abstracts of dissertations theses, and research papers submitted by candidates for degrees, 1 October 1979 - 30 September 1980 [AD-A104124] N82-13974

THREE DIMENSIONAL FLOW
Three dimensional flow investigation with a method of characteristics in the inlet region and the blade-to-blade channels of supersonic axial compressors [ESA-TT-637] N82-12078
Prediction and measurement of time-variant, three-dimensional flows in military aircraft intakes N82-13069
A numerical method for studying nacelle-jet-airfoil interaction in inviscid three-dimensional flow N82-13094

THREE DIMENSIONAL MOTION
Experimental evaluation of a perspective tunnel display for three-dimensional helicopter approaches A82-15847

THRUST
Integration of advanced exhaust nozzles N82-13075
Establishment of an experimental technique to provide accurate measurement of the installed drag of close coupled civil nacelle/airframe configurations, using a full span model with turbine powered engine simulators N82-13089

THRUST CONTROL
Thrust modulation methods for a subsonic V/STOL aircraft [NASA-TM-82747] N82-13112

THRUST REVERSAL
Advanced exhaust nozzle technology N82-13078

THRUST VECTOR CONTROL
Effect of a part span variable inlet guide vane on TF34 fan performance [NASA-CR-165458] N82-12075
Advanced exhaust nozzle technology N82-13078
A real time Pegasus propulsion system model for VSTOL piloted simulation evaluation [NASA-TM-82770] N82-13144

THRUST-WEIGHT RATIO
Enhanced F-15 air-to-ground flight demonstrations [AIAA PAPER 81-2413] A82-13854

THUNDERSTORMS
Thunderstorm hazards flight research - Program overview [AIAA PAPER 81-2412] A82-13853
Operational evaluation of thunderstorm penetration test flights during project Storm Hazards '80 A82-14954

TILT ROTOR AIRCRAFT
Hover tests of the XV-15 Tilt Rotor Research Aircraft [AIAA PAPER 81-2501] A82-14386

TIMBER INVENTORY
A VHF homing system with VHF radiotelephony for area-representative strip-survey flights conducted, as part of combined forest inventories, with light aircraft carrying 70 mm and 35 mm cameras A82-15748

TIME DIVISION MULTIPLE ACCESS
Distributed Time Division Multiple Access /DTDMA/ - A distributed signaling technique for advanced tactical communications A82-14719

TIME DIVISION MULTIPLEXING
A modular multiplexed digital voice intercommunications system A82-14721

TIME FUNCTIONS
A recursive time domain analysis of distributed line grid networks with application to the LTA/EMP problem --- Lightning Threat Analysis A82-14761

TIME OPTIMAL CONTROL
Comparison between the exact and an approximate feedback solution for medium range interception problems A82-13106

TIME SHARING
A polled contention multiplex system using MIL-STD-1553 protocol [AIAA 81-2271] A82-13487

TORQUE
Determining hinge moments and empennage airload parameters from flight data for Learjet airplanes A82-13120

TORSION
Wind-tunnel investigation of the effects of blade tip geometry on the interaction of torsional loads and performance for an articulated helicopter rotor [NASA-TP-1926] N82-13107

TORSIONAL VIBRATION
Flight testing the nonmetallic spline coupling technology at the Naval Air Test Center [AIAA PAPER 81-2405] A82-13891

TRACKING NETWORKS
Status and tracking system for flight test data products
[AIAA PAPER 81-2395] A82-14376
TRACKING RADAR
Georgia Tech coherent jammer flight test
[AIAA PAPER 81-2452] A82-13898
Using phased array radar for data communications
A82-14725
TRAINING AIRCRAFT
62% manned aircraft demonstrator - Next generation trainer --- cost effective pilot trainer
[AIAA PAPER 81-2519] A82-14385
USNTPS spin program
A82-14931
The USAF Test Pilot School high angle of attack and spin training program
A82-14932
TRAINING EVALUATION
Organizing and training for innovative flight test management
[AIAA PAPER 81-2416] A82-13856
Assessing pilot workload - Without disturbing pilot behavior
A82-14745
TRAINING SIMULATORS
Low cost programmable multisimulator facility
[AIAA 81-2229] A82-13534
Group 1: Scenario design and development issues
N82-13131
TRAJECTORY CONTROL
Experience with flight test trajectory guidance
[AIAA PAPER 81-2504] A82-14379
The Maneuvering Flight Path Display - A flight trajectory solution display concept
A82-14824
TRAJECTORY OPTIMIZATION
Darboux points in minimum-fuel aircraft landing problems
A82-13077
Fuel efficient flight profiles in an ATC flow management environment
A82-13078
On-line optimization of aircraft altitude and flight path angle dynamics
A82-13107
Application of singular perturbation theory
N82-12050
TRANSCONTINENTAL SYSTEMS
Transportation systems evaluation methodology development and applications, phase 3
[NASA-CR-164999] N82-12051
TRANSMISSION EFFICIENCY
Columbus, Ohio, Voice response system demonstration and evaluation
[AD-A104750] N82-12304
TRANSMISSION LINES
Wire strike protection
A82-13246
Portable air driven variable speed fiber optic cable termination polisher
[AD-A104797] N82-12448
TRANSMISSIONS (MACHINE ELEMENTS)
In-flight computation of helicopter transmission fatigue life expenditure
[AIAA PAPER 81-2434] A82-13872
TRANSONIC FLOW
Remarks on the calculation of transonic potential flow by a finite volume method
A82-15835
Transonic flows in an air inlet with large incidence and the effect of a blowing trap
N82-13071
Model testing techniques for measuring inlet drag
N82-13084
Calculation of wing-body-nacelle interference in subsonic and transonic potential flow
N82-13095
Airframe-propulsion system aerodynamic interference predictions at high transonic Mach numbers including off-design engine airflow effects
N82-13098
Prediction of aerodynamic loads on aircrafts with external stores at transonic speeds
N82-13813
TRANSONIC WIND TUNNELS
Development of a lifting parachute to provide self-dispersing capability for an Avco-designed tactical munition
[AIAA PAPER 81-1928] A82-13962
Aeroelasticity matters - Some reflections on two decades of testing in the NASA Langley Transonic Dynamics Tunnel
A82-13969
The development of cryogenic wind tunnels and their application to maneuvering aircraft technology
A82-13971
Aeroelasticity matters: Some reflections on two decades of testing in the NASA Langley transonic dynamics tunnel
[NASA-TM-83210] N82-12041
Construction and performance of NAL two-dimensional transonic wind tunnel
[NAL-TR-647] N82-12083
A look inside the Langley 16-foot transonic tunnel: User's guide
[NASA-TM-83186] N82-12085
TRANSPONDERS
Aircraft separation assurance avionics
[AIAA 81-2239] A82-13467
TRANSPORT AIRCRAFT
Applications of digital avionics to commercial transport aircraft - The DC-9 Super 80 and beyond
[AIAA 81-2218] A82-13456
Electronic flight deck displays for transport aircraft
[AIAA 81-2264] A82-13483
Applications of head-up displays in commercial transport aircraft
[AIAA 81-2300] A82-13506
On-board communication for active-control transport aircraft
[AIAA 81-2321] A82-13520
Operational evaluation of the new generation of jet transport aircraft
[AIAA PAPER 81-2377] A82-13942
Progress in aeronautical research and technology applicable to civil air transports
A82-13974
An advanced facility for processing aircraft dynamic test data
[AIAA PAPER 81-2398] A82-14377
Wing design for light transport aircraft with improved fuel economy
A82-14416
Enhanced aircraft handling qualities by longitudinal dynamics mode decoupling
A82-14826
In-service inspection methods for graphite-epoxy structures on commercial transport aircraft
[NASA-CR-165746] N82-12142
Electronic flight deck displays for military transport aircraft
N82-13050
Aerodynamics of Power Plant Installation
[AGARD-CP-301] N82-13065
Aerodynamic aspects of a high bypass ratio engine installation on a fuselage afterbody
N82-13093
TRAPEZOIDAL TAIL SURFACES
Pressure distributions on three different cruciform aft-tail control surfaces of a wingless missile at Mach 1.60, 2.36, and 3.70. Volume 1: Trapezoidal tail
[NASA-TM-80097] N82-13110
TRENDS
Advantages and limitations of various materials used in the construction of modules --- aircraft construction
[SNIAS-812-551-103] N82-12072
TURBINE BLADES
The protection of gas turbine blades - A platinum aluminide diffusion coating
A82-14364
The operational characteristics of turbojets, giving particular attention to the cooled high-pressure turbine
A82-14414
Progress in protective coatings for aircraft gas turbines: A Review of NASA sponsored research
[NASA-TM-82740] N82-12216

TURBINES
Wind tunnel tests of powered models: A comparison of two methods of simulating the jets of jet engines N82-13087
TURBOCOMPRESSORS
Three dimensional flow investigation with a method of characteristics in the inlet region and the blade-to-blade channels of supersonic axial compressors [ESA-TT-637] N82-12078
TURBOFAN ENGINES
Performance assessment of an advanced reheated turbo fan engine [AIAA PAPER 81-2447] A82-13879
The all composite Lear Fan 2100 A82-14936
Sensor failure detection system --- for the F100 turbofan engine [NASA-CR-165515] N82-13145
TURBOJET ENGINE CONTROL
An approach to robust nonlinear control design --- with illustration of J-85 turbojet engine simulation A82-13128
Compressor stall inducing installation effects of an engine control parameter for the CF-5 aircraft N82-13085
TURBOJET ENGINES
The operational characteristics of turbojets, giving particular attention to the cooled high-pressure turbine A82-14414
Optimization of requirements on the pitting-prevention properties of turbojet-engine oils A82-15723
Vibration test procedures for accessory angle drive gearboxes on Atar 09C engines --- turbojet engines [AD-A105269] N82-12076
TURBOMACHINERY
The role and implementation of different nacelle/engine simulation concepts for wind-tunnel testing in research and development work on transport aircraft N82-13086
TURBOPROP ENGINES
CT7 - GE attacks commuter turboprop market A82-15950
TURBULENT FLOW
The numerical solution of incompressible turbulent flow over airfoils N82-12030
Turbulent wake development behind streamlined bodies N82-13104
TURBULENT WAKES
Turbulent wake development behind streamlined bodies N82-13104

U

UNLOADING
C-5A unsurfaced taxi and off-load demonstrations [AIAA PAPER 81-2439] A82-13875
UNSTEADY FLOW
An acquisition and analysis system for dynamic tests of air inlets N82-13082
UPPER SURFACE BLOWING
Ball-Bartoe Jetwing flight tests A82-14928
USER REQUIREMENTS
Public service helicopters - Is the grass greener on the other side of the fence A82-13238
Transportation systems evaluation methodology development and applications, phase 3 [NASA-CR-164999] N82-12051
UTILIZATION
Advantages and limitations of various materials used in the construction of modules --- aircraft construction [SNIAS-812-551-103] N82-12072

V

V/STOL AIRCRAFT
Commentary on facilities used in the development of a Sea Harrier all weather operations capability [AIAA PAPER 81-2407] A82-13892
Jet V/STOL wind-tunnel simulation and groundplane effects A82-13973
The X-14 - 24 years of V/STOL flight testing A82-14927
Thrust modulation methods for a subsonic V/STOL aircraft [NASA-TM-82747] N82-13112
A real time Pegasus propulsion system model for VSTOL piloted simulation evaluation [NASA-TM-82770] N82-13144
VACUUM EFFECTS
Effect of vacuum exhaust pressure on the performance of MHD ducts at high B-field [NASA-TM-82750] N82-13908
VAPORS
A vapour cycle cabin cooling system for the Sea King MK.50 helicopter [AD-A105211] N82-12069
VARIABLE GEOMETRY STRUCTURES
The subsonic performance of practical military variable area convergent nozzles N82-13076
VATOL AIRCRAFT
Application of the concept of dynamic trim control and nonlinear system inverses to automatic control of a vertical attitude takeoff and landing aircraft [AIAA 81-2238] A82-13466
VECTOR ANALYSIS
Electro-optical vector scoring system --- for missile miss distance in fleet training exercises [AIAA PAPER 81-2373] A82-13945
VELOCITY MEASUREMENT
The use of groundspeed, in a wind shear and the flight evaluation of a radar-altimeter-based system for the measurement of groundspeed [AD-A104758] N82-12060
VENTILATION
A vapour cycle cabin cooling system for the Sea King MK.50 helicopter [AD-A105211] N82-12069
VERTICAL DISTRIBUTION
German-Argentine experiment: Vertical-rotor wind engine N82-12648
VERTICAL MOTION SIMULATORS
Simulator certification methods and the vertical motion simulator [NASA-CR-166252] N82-12082
VIBRATION DAMPING
Wing/store flutter - An active adaptive control application A82-13122
Flight testing the nonmetallic spline coupling technology at the Naval Air Test Center [AIAA PAPER 81-2405] A82-13891
VIBRATION TESTS
Vibration test procedures for accessory angle drive gearboxes on Atar 09C engines --- turbojet engines [AD-A105269] N82-12076
VIDEO DATA
Extended time radar raw video recording A82-14909
VISCOUS FLOW
The numerical solution of incompressible turbulent flow over airfoils N82-12030
VISIBILITY
Use of a helmet-mounted matrix display for presenting energy-maneuverability information during simulated close combat N82-13061
VISUAL AIDS
Group 1: Scenario design and development issues N82-13131
VISUAL CONTROL
The effect of visual information on manual approach and landing [NLR-MP-80019-U] N82-12064

VISUAL PERCEPTION
Airborne color CRT displays
A82-14823
VOICE COMMUNICATION
High-accuracy ranging over voice radios for downed aircrew rescue
A82-14694
A modular multiplexed digital voice intercommunications system
A82-14721
Columbus, Ohio, Voice response system demonstration and evaluation
[AD-A104750] N82-12304
VOICE CONTROL
Using voice control onboard combat aircraft
N82-13056
VORTICES
Experimental and analytical studies of a model helicopter rotor in hover
[NASA-TM-81232] N82-12042

W

WARNING SYSTEMS
Aircraft alerting systems standardization study
[AIAA 81-2242] A82-13468
Digital detection and processing of laser beacon signals for aircraft collision hazard warning
[AIAA 81-2328] A82-13525
WAVE PROPAGATION
Updated station deselection procedures to support automatic Omega receiver operation
A82-14712
WEAPON SYSTEM MANAGEMENT
Advanced weapon systems - Integration technology --- Digital Avionic Information System
[AIAA 81-2213] A82-13533
Government testing
[AIAA PAPER 81-2443] A82-13877
Naval Weapons Center - Test and evaluation in the 1980's
[AIAA PAPER 81-2485] A82-13940
WEAPON SYSTEMS
Light Airborne Multi-Purpose System
A82-13244
Integrated avionics - Concepts and concerns
[AIAA 81-2211] A82-13452
F/A-18A weapon system - 1976 state of the art
[AIAA 81-2215] A82-13453
Avionics implications from weapon system operational utility studies on Manned Air Combat Simulators
[AIAA 81-2230] A82-13463
LHX - An advanced avionics system design
[AIAA 81-2249] A82-13472
Higher order Information Transfer Systems are coming
[AIAA 81-2317] A82-13517
Enhanced F-15 air-to-ground flight demonstrations
[AIAA PAPER 81-2413] A82-13854
Theoretical analysis of wake-induced parachute collapse
[AIAA PAPER 81-1922] A82-13963
Fighters - Improving the breed
A82-14354
Testing capabilities of the 3246th Test Wing
[AIAA PAPER 81-2484] A82-14387
Assessing pilot workload - Without disturbing pilot behavior
A82-14745
Evaluation of advanced air-to-air gunnery fire control systems
A82-14750
WEAPONS DELIVERY
F-4 Advanced Avionics Flight Test
[AIAA PAPER 81-2464] A82-13929
Development of a lifting parachute to provide self-dispersing capability for an Avco-designed tactical munition
[AIAA PAPER 81-1928] A82-13962
Advanced fighter technology integration AFTI/F-16 test program overview
[AIAA PAPER 81-2353] A82-14398
Weapon delivery system using GPS
A82-14711
Integrated Flight/Weapon Control design and evaluation
A82-14741

Airborne Electronic Terrain Map System. II - Applications
A82-14773
WEATHER
Weather impact on low-altitude imaging infrared sensors in Europe - An availability model
A82-14779
WEATHERING
Practical aspects of instrumentation system installation, volume 13
[NASA-TM-84067] N82-13140
WEIGHT INDICATORS
Evaluation and wind tunnel tests of the 4,000 lb (normal-force) pitch/yaw and roll dynamic stability balance systems for measuring direct, cross, and cross-coupling derivatives
[AD-A105122] N82-12047
WEIGHT REDUCTION
High voltage/high power for airborne applications
A82-15918
WIND EFFECTS
The influence of wind shear and vertical winds on takeoffs and go-arounds
A82-15823
WIND SHEAR
A decoupled control system for improved flight performance in wind shear
A82-13079
A criterion for determining the causes of wind shear at Punta Raisi Airport, on the basis of statistical data from barograph records
A82-15468
The influence of wind shear and vertical winds on takeoffs and go-arounds
A82-15823
The use of groundspeed, in a wind shear and the flight evaluation of a radar-altimeter-based system for the measurement of groundspeed
[AD-A104758] N82-12060
WIND TUNNEL APPARATUS
Evaluation and wind tunnel tests of the 4,000 lb (normal-force) pitch/yaw and roll dynamic stability balance systems for measuring direct, cross, and cross-coupling derivatives
[AD-A105122] N82-12047
Construction and performance of NAL two-dimensional transonic wind tunnel
[NAL-TR-647] N82-12083
A look inside the Langley 16-foot transonic tunnel: User's guide
[NASA-TM-83186] N82-12085
WIND TUNNEL CALIBRATION
Construction and performance of NAL two-dimensional transonic wind tunnel
[NAL-TR-647] N82-12083
WIND TUNNEL MODELS
Aeroelasticity matters - Some reflections on two decades of testing in the NASA Langley Transonic Dynamics Tunnel
A82-13969
A review of flight-to-wind tunnel drag correlation
[AIAA PAPER 81-2475] A82-14382
An investigation of F-16 nozzle-afterbody forces at transonic Mach numbers with emphasis on model scale effects
[AD-A104905] N82-12392
Wind tunnel test and analysis techniques using powered simulators for civil nacelle installation drag assessment
N82-13088
Establishment of an experimental technique to provide accurate measurement of the installed drag of close coupled civil nacelle/airframe configurations, using a full span model with turbine powered engine simulators
N82-13089
Pressure distributions on three different cruciform aft-tail control surfaces of a wingless missile at Mach 1.60, 2.36, and 3.70. Volume 1: Trapezoidal tail
[NASA-TM-80097] N82-13110
Thrust modulation methods for a subsonic V/STOL aircraft
[NASA-TM-82747] N82-13112
WIND TUNNEL STABILITY TESTS
Direct free-flight analysis of aircraft dynamics at high angles of attack
A82-15596

WIND TUNNEL TESTS
Navy performance modeling techniques [AIAA PAPER 81-2431] A82-13869
Overview of flight and ground testing with emphasis on the wind tunnel [AIAA PAPER 81-2474] A82-13928
A large-scale investigation of engine influence on inlet performance at angle-of-attack [AIAA PAPER 81-2481] A82-13939
Aeroelasticity matters - Some reflections on two decades of testing in the NASA Langley Transonic Dynamics Tunnel A82-13969
The development of cryogenic wind tunnels and their application to maneuvering aircraft technology A82-13971
Jet V/STOL wind-tunnel simulation and groundplane effects A82-13973
A review of flight-to-wind tunnel drag correlation [AIAA PAPER 81-2475] A82-14382
Comparison of wind tunnel and theoretical aeroelastic predictions with flight measured airloads for the B-1 aircraft [AIAA PAPER 81-2387] A82-14393
Analysis of escape systems at 687 KEAS A82-14978
Wind tunnel tests of ejection seat for high dynamic pressure escape A82-14979
Aeroelasticity matters: Some reflections on two decades of testing in the NASA Langley transonic dynamics tunnel [NASA-TM-83210] N82-12041
Construction and performance of NAL two-dimensional transonic wind tunnel [NAL-TR-647] N82-12083
Performance of highly integrated inlets for supersonic aircraft N82-13066
Wind tunnel tests of powered models: A comparison of two methods of simulating the jets of jet engines N82-13087
Wind tunnel test and analysis techniques using powered simulators for civil nacelle installation drag assessment N82-13088
Studies of air inlets at Reynolds numbers comparable to flight in ONERA's F1 and S1MA wind tunnels N82-13091
The influence of closed-coupled, rear fuselage mounted nacelles on the design of an advanced high speed wing N82-13092
Wind-tunnel investigation of the effects of blade tip geometry on the interaction of torsional loads and performance for an articulated helicopter rotor [NASA-TP-1926] N82-13107
Pressure distributions on three different cruciform aft-tail control surfaces of a wingless missile at Mach 1.60, 2.36, and 3.70. Volume 1: Trapezoidal tail [NASA-TM-80097] N82-13110
Final report on the FuePo-4 major theme: Interference drag with airframe/engine integration on fighter aircraft [BMVG-FBWT-79-20] N82-13116
WINDOWS (APERTURES)
Algorithms for an adaptive dynamic window in electronic map systems A82-14769
WINDPOWERED GENERATORS
German-Argentine experiment: Vertical-rotor wind engine N82-12648
WING FLOW METHOD TESTS
Wing design for light transport aircraft with improved fuel economy A82-14416
WING LOADING
Divergence of a sweptforward wing A82-13560
Effect of fighter attack spectrum on composite fatigue life [AD-A105034] N82-12143
WING NACELLE CONFIGURATIONS
Establishment of an experimental technique to provide accurate measurement of the installed drag of close coupled civil nacelle/airframe configurations, using a full span model with turbine powered engine simulators N82-13089
Evaluation of an experimental technique to investigate the effects of the engine position on engine/pylon/wing interference N82-13090
A numerical method for studying nacelle-jet-airfoil interaction in inviscid three-dimensional flow N82-13094
WING OSCILLATIONS
Aeroelasticity matters: Some reflections on two decades of testing in the NASA Langley transonic dynamics tunnel [NASA-TM-83210] N82-12041
WING ROOTS
AV-8B technical update - Leading edge root extension development A82-14940
WING-FUSELAGE STORES
Wing/store flutter - An active adaptive control application A82-13122
WINGED VEHICLES
In-flight deflection measurement of the HiMAT aeroelastically tailored wing [AIAA PAPER 81-2450] A82-14381
WINGS
Calculation of wing-body-nacelle interference in subsonic and transonic potential flow N82-13095
Prediction of aerodynamic loads on aircrafts with external stores at transonic speeds N82-13813
WIRE
Wire strike protection A82-13246
WORKING FLUIDS
Efficient use of working fluids in aviation hydraulic systems A82-15724
WORKLOADS (PSYCHOPHYSIOLOGY)
Assessing pilot workload - Without disturbing pilot behavior A82-14745

X

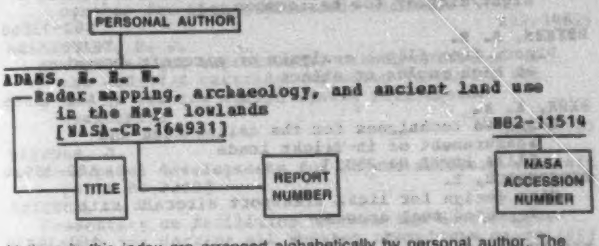
X-14 AIRCRAFT
The X-14 - 24 years of V/STOL flight testing A82-14927
XV-15 AIRCRAFT
Hover tests of the XV-15 Tilt Rotor Research Aircraft [AIAA PAPER 81-2501] A82-14386

Y

YAG LASERS
Options for GTS precision automated tracking system --- airborne laser tracking system A82-13020

PERSONAL AUTHOR INDEX

Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the title, e.g., N82-11514. Under any one author's name the accession numbers are arranged in sequence with the *IAA* accession numbers appearing first.

A

ABELSON, P. H.
Costs of noise nuisance from aircraft A82-13314

ABLA, M. M.
Determining hinge moments and empennage airload parameters from flight data for Learjet airplanes A82-13120

ACCARINO, N.
A new approach to radar plot extraction for ATC applications A82-14908

ACKERMANN, J.
Robust flight control - A design example A82-15845

ADAM, R. C.
F/A-18 'Hornet' - One man operability [AIAA 81-2266] A82-13484
F/A 18 Hornet crew station N82-13064

ADOLPH, C. E.
The Air Force Flight Test Center - Utah Test and Training Range in the 1980's [AIAA PAPER 81-2407] A82-13916

AFREMOV, V. G.
Current aerial cameras A82-15655

AGGARWAL, A. K.
Weapon delivery system using GPS A82-14711

AKHTER, M. M.
Sensor failure detection system [NASA-CR-165515] N82-13145

ALBERT, V. R.
Helicopter IFR - Past, present and future and future A82-13245

ALLEN, J. H.
Weather impact on low-altitude imaging infrared sensors in Europe - An availability model A82-14779

ALTMAN, R. L.
Fire extinguishant materials [NASA-CASE-ARC-11252-1] N82-12168
Development and testing of dry chemicals in advanced extinguishing systems for jet engine nacelle fires [NASA-CR-165011] N82-13186

ALVAREZ, J.
Effect of a part span variable inlet guide vane on TF34 fan performance [NASA-CR-165458] N82-12075

ANDERSON, L. R.
Computational methods of robust controller design for aerodynamic flutter suppression [NASA-CR-164983] N82-12080

ANDERSSON, A. O.
Aircraft absorbers - Promise and practice A82-14042

ANDREWS, H. W.
Georgia Tech coherent jammer flight test [AIAA PAPER 81-2452] A82-13898

ANDREWS, W. H.
AD-1 oblique wing aircraft program [AIAA PAPER 81-2354] A82-14390

ARCHER, R. S., III
The application of large screen CRT's, touch panels, and voice to the flight stations of the 1990's [AIAA 81-2263] A82-13482

ARDEMA, M. D.
Air-to-air combat analysis - Review of differential-gaming approaches A82-13115

ARETZ, A. J.
Software considerations in the design of computer generated flight displays A82-14742

ASHER, H. J.
Helicopter reliability and maintainability trends during development and production [AD-A105775] N82-13136

AST, W. G.
Advanced display systems for crew stations of tactical aircraft [AIAA 81-2312] A82-13514

ATTLFELLNER, S.
System identification helicopter parameters. Determination from flight tests, phase 2 [BMVG-FBWT-80-12] N82-13137

ATZHORN, D.
Design and flight test of a lateral-directional command augmentation system [AIAA 81-2331] A82-13527

AYERS, T. G.
A review of flight-to-wind tunnel drag correlation [AIAA PAPER 81-2475] A82-14302

B

BABB, C. D.
Pressure distributions on three different cruciform aft-tail control surfaces of a wingless missile at Mach 1.60, 2.36, and 3.70. Volume 1: Trapezoidal tail [NASA-TM-80097] N82-13110

BADALIANCE, R.
Effect of fighter attack spectrum on composite fatigue life [AD-A105034] N82-12143

BAER-RIEDHART, J. L.
The development and flight test evaluation of an integrated propulsion control system for the HiMAT research airplane [AIAA PAPER 81-2467] A82-13931

BAHANASSY, M.
Digital simulation of aircraft electrical generating system by means of Sceptre program A82-14820

BAIER, H. J.
Mathematical programming in engineering design problems A82-15864

BALASUBRAMANYAN, C.
Prediction of aerodynamic loads on aircrafts with external stores at transonic speeds N82-13813

BALIUK, A. D.
Study of the load-carrying capacity of aviation gas-turbine engine impellers under low-cycle loading at normal and high temperatures
A82-15482
BALKE, H.
Maneuver load control for the reduction of design loads and improvement of the maneuverability of modern fighter aircraft
[BMVG-FBWT-81-2] N82-13138
BANG, C.
Overview of flight and ground testing with emphasis on the wind tunnel
[AIAA PAPER 81-2474] A82-13928
BARAN, Y.
Fixed gain controller design for aircraft
[AD-A104877] N82-12081
BARBATO, G. J.
Tanker avionics and aircrew complement evaluation
N82-13063
BARTLETT, F. D., JR.
Flight vibration optimization via conformal mapping
A82-13975
BASKETT, B. J.
The TADS/PNVS 'eyes' for the AH-64 attack helicopter
A82-13239
BATSON, V. M.
A unique integrated flight testing facility for advanced control/display research
[AIAA PAPER 81-2490] A82-13919
BAXTER, D.
ATARK laser tracking system
A82-13016
BAZHENOV, V. G.
Study of the load-carrying capacity of aviation gas-turbine engine impellers under low-cycle loading at normal and high temperatures
A82-15482
BEAIRD, H. G., JR.
The all composite Lear Fan 2100
A82-14936
BEATTIE, E. C.
Sensor failure detection system
[NASA-CR-165515] N82-13145
BECLE, J. P.
Wind tunnel tests of powered models: A comparison of two methods of simulating the jets of jet engines
N82-13087
BEDRIK, B. G.
Efficient use of working fluids in aviation hydraulic systems
A82-15724
BEHEIM, M. A.
NASA research in aircraft propulsion
[NASA-TM-82771] N82-13146
BEHEL, I. M.
F/A-18A high angle of attack/spin testing
A82-14934
BEHNKE, S. W.
Implementing the DAIS executive
A82-14814
BEMENT, L. J.

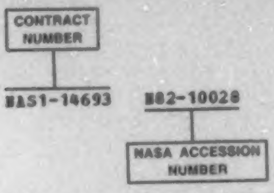
CONTRACT NUMBER INDEX

Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the *IAA* accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the *IAA* or *STAR* section.

AERONAUTICAL ENGINEERING

A CONTINUING BIBLIOGRAPHY WITH INDEXES

(Supplement 147)

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in March 1982 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA).*

NASA Scientific and Technical Information Branch 1982
National Aeronautics and Space Administration
Washington, DC

This supplement is available as NTISUB 141/093 from the National Technical Information Service (NTIS), Springfield, Virginia 22161 at the price of $5.00 domestic; $10.00 foreign.

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971.

This supplement to *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 347 reports, journal articles, and other documents originally announced in March 1982 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA).*

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries*, in that order. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* and *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes -- subject, personal author, and contract number -- are included.

An annual cumulative index will be published.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A82-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at $8.00 per document. Microfiche[1] of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand, and at the rate of $1.35 per microfiche for standing orders for all *IAA* microfiche.

Minimum air-mail postage to foreign countries is $2.50 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N82-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26.1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

ICING TUNNEL TEST OF A GLYCOL-EXUDING POROUS LEADING EDGE ICE PROTECTION SYSTEM ON A GENERAL AVIATION AIRFOIL Final Report
David L. Kohlman, William G. Schweikhard, and Alan E. Albright
Sep. 1981 37 p refs
(Grant NAG3-71)
(NASA-CR-165444; KU-FRL-464-1) Avail: NTIS
HC A03/MF A01 CSCL 01C

Test results show that the system is very effective in preventing ice accretion (anti-ice mode) or removing ice from an airfoil. Minimum glycol flow rates required for antiicing are a function of velocity, liquid water content in the air, ambient temperature, and droplet size. Large ice caps were removed in only a few minutes using anti-ice flow rates, with the shed time being a function of the type of ice, size of the ice cap, angle of attack, and glycol flow rate. Wake surveys measurements show that no significant drag penalty is associated with the installation or operation of the system tested.

A82-11317 # **Development of aircraft production engineering discipline at IIT, Bombay.** N. K. Naik (Indian Institute of Technology, Bombay, India). *Aeronautical Society of India, Journal*, vol. 31, Feb.-Nov. 1979, p. 119-125.

The aircraft production engineering courses offered at the Indian Institute of Technology, in Bombay, are discussed. To demonstrate the value of the courses, the fundamentals of aircraft production are outlined, the discussion being confined to airframe production. The loft-template method is described, and the principal loft-template scheme used in aircraft production is shown. Also described are the theory and laboratory courses offered at the institute.

AERONAUTICAL ENGINEERING

A Continuing Bibliography (Suppl. 147)

APRIL 1982

IAA ENTRIES

A82-16025 **A high strength ejector release unit for the Tornado.** L. Botting (Normalair-Garrett, Ltd., Yeovil, Somerset, England). *Aircraft Engineering,* vol. 53, Nov. 1981, p. 10-15.

The development of bomb ejector release units (ERU) is traced, and an ERU suitable for the MACE form of suspension is described. The design of the ERU is provided, noting its use on the Tornado and its acceptability for NATO armaments. Reduced drag has been experienced by use of the ERU, and sway-bracing is achieved without crutch arms, although these can added with a conversion kit. A 3.3 m/sec ejection velocity has been measured for a store mass of 544 kg within a reaction limitation of 44.5 kn. The unit withstands 30 firings before maintenance, and recommendations for system alterations for use with smart weapons are outlined. M.S.K.

A82-16040 # **On unsteady aerodynamic forces and moments of the circular cascading blades /Experiments of the outward-flow case/.** K. Nishioka and H. Kuroda (National Defense Academy, Yokosuka, Kanagawa, Japan). *JSME, Bulletin,* vol. 24, Oct. 1981, p. 1739-1747. 15 refs.

The unsteady forces and moments acting on the blades of centrifugal machines which vibrate harmonically in a torsional mode about the mid-chord have been studied experimentally. At small interblade phase angles, the unsteady normal forces and moments are found to vary periodically as a function of the cascade geometry, flow coefficient, and the wake length of vortex distribution; for small flow coefficients, the damping moments become negative. When the interblade phase angle is more than 180 deg, the aerodynamic damping moment becomes negative for relatively small reduced frequencies. As the interblade phase angle increases still further, the damping moment becomes negative even at comparatively large reduced frequencies. Experimental results are in qualitative agreement with theory. V.L.

A82-16091 # **Workshop report for the AIAA 6th Aeroacoustics Conference.** C. K. W. Tam (Florida State University, Tallahassee, FL). *Journal of Aircraft,* vol. 18, Dec. 1981, p. 1005-1010. 5 refs.

Summaries are given of the workshops conducted at the AIAA 6th Aeroacoustics Conference, each summary having been prepared by the workshop chairman. The six workshops are: jet noise, duct acoustics, turbomachinery noise, aircraft interior noise, airframe and propulsive lift noise, and propeller and helicopter noise. It is noted that the primary purpose of the workshops is to provide a forum where new ideas and concepts can be openly discussed and controversies freely debated. C.R.

A82-16092 # **Infrared emissions from turbofans with high aspect ratio nozzles.** R. Decher (Washington, University, Seattle, WA). *Journal of Aircraft,* vol. 18, Dec. 1981, p. 1025-1031. 12 refs.

A mixed flow turbofan is analyzed from the point of view of IR emission characteristics. A simple absorption coefficient model of the core flow gas displays the potential effectiveness of high aspect ratio nozzles as a variable in the design of aircraft engine installations for low IR signature. The simplicity of the model described and the limited view perspectives used to assess the signature restrict the usefulness of the results to that of guiding preliminary design. In general, more precise solutions are complex and depend on specification of a relatively large number of independent variables to describe the source - seeker geometry, weather, etc. The level of effort to carry out more accurate analysis may be inconsistent with the preliminary design process where simple criteria such as those described may be sufficient to select the best of several candidate designs. The influence of cycle parameters is assessed using an n-th power dependence of radiation on temperature and a simple mixing model to estimate the core length. The analysis shows that cycle parameters which improve cycle efficiency and thus fuel consumption also reduce IR emissions. Bypass ratio near unity gives low IR signature for both optically thin and thick spectral regions. (Author)

A82-16093 # **Symmetric flow characteristics of thin rectangular wings.** E. S. Larson (Flygtekniska Forsoksanstalten, Stockholm, Sweden). *Journal of Aircraft,* vol. 18, Dec. 1981, p. 1070, 1071. 7 refs. Research supported by the Defence Materiel Administration.

Semiempirical analytic expressions are presented which are shown to contain in themselves Mach number influences that are in very good agreement with the investigated panel method results for M less than or equal to 1, the intended regime of application of the equations. The differences between the equations and the theoretical results are small and in fact only of minor significance when shortcut evaluations are desired. It is noted, however, that a comparison with relevant transonic experimental results, if such results existed, would show an appreciable discrepancy in the transonic regime as a result of the neglect of genuine transonic terms in the linearized theory. C.R.

A82-16135 # **Aerospace highlights 1981.** *Astronautics and Aeronautics,* vol. 19, Dec. 1981, p. 24-34, 36-40, 42-108.

Topics such as air transportation systems, aeroacoustics, aerospace power systems, aircraft design, interactive computer graphics, and flight simulation are considered. Attention is also given to flight mechanics, extendible exit cones, general aviation systems, LTA vehicles, and testing programs. Plasma dynamics and lasers are discussed, as are solid rockets, propellants, software systems, sensors, marine technologies, and CAD/CAM. Finally, papers are presented on terrestrial energy systems, structural dynamics, space sciences, space structures, thermophysics, V/STOL aircraft, aerospace maintenance, communications, economics, and electric propulsion, as well as materials, management, and guidance and control. M.S.K.

A82-16143 **Aircraft composite materials and structures.** S. J. Dastin (Grumman Aerospace Corp., Advanced Development Section, Bethpage, NY). *SAMPE Journal,* vol. 17, Nov.-Dec. 1981, p. 10-15.

A ten year advanced composite aircraft structural history is reviewed. Composite material development is traced from fiberglass epoxy to mixed fiber polymer hybrids containing boron, graphite and Kevlar. Typical composites processing and tooling approaches utilized in the industry is given along with techniques being developed for high volume production. (Author)

A82-16145 **The well tempered transport aircraft engine /The Sir Henry Royce Memorial Lecture/.** J. G. Borger. *Aeronautical Journal,* vol. 85, Nov. 1981, p. 395-413.

An historical account is presented of the development, over 45 years, of nine piston and eight turbofan and turbojet engines as installed in 22 different transport aircraft. Attention is given to the contribution of engine design to improvements in overall aircraft performance, as highlighted by such contrasting figures as (1) the 600-800 hour overhaul periods considered acceptable during the Second World War and the 10,000-hour periods typical of present transport aircraft, and (2) the 150 mph speeds and 2400-mile ranges of 84,000-lb aircraft carrying 20 passengers by comparison to 550 mph, 4500-mile range figures for 800,000-lb aircraft carrying 450 passengers. Performance figures are given for engines representative of the state-of-the-art at pivotal points of engine and airframe design development. O.C.

A82-16147 **Digital active control system for load alleviation for the Lockheed L-1011.** G. E. Bendixen (Rockwell International Corp., Cedar Rapids, IA), R. F. O'Connell, and C. D. Siegert (Lockheed-California Co., Burbank, CA). *Aeronautical Journal*, vol. 85, Nov. 1981, p. 430-436. 5 refs.

A digital active control system (ACS) is described which is used to reduce maneuver and gust loads in the extended-wing L-1011 TriStar, permitting improved aircraft performance with minimal wing structure changes. Reliability requirements aimed at high system availability are satisfied by means of a dual-dual, fail operational system architecture in which each of the two ACS computers contains two digital processors. The digital computer provides for control of the aileron servos, self-test capability and redundancy management. Attention is given the compatibility of automatic and primary flight control systems, the digital sensor data transfer functions of the ACS computer and its Algol-like software configuration, redundancy management, and servo and computer monitoring. O.C.

A82-16148 **Scattering of sound by a vortex ring.** T. Kambe and U. M. Oo (Kyushu University, Fukuoka, Japan). *Physical Society of Japan, Journal*, vol. 50, Oct. 1981, p. 3507-3516. 13 refs.

The scattering of a plane acoustic wave by a vortex ring is analyzed in terms of the Lighthill theory of aerodynamic sound generation. A formula for the scattered pressure is obtained from the term representing the interaction of the sound wave with the flow in the source terms of the inhomogeneous wave equation, and is applied to the case of scattering by a circular vortex ring in translational motion. Scattering amplitudes and cross sections are evaluated numerically for the case of slow motion. The total scattering cross section is found to depend not only on the wavelengths of the incident wave, but on the Mach number and direction of a vortex motion. A comparison reveals the scattering power of the vortex ring to be small in relation to that of a solid sphere of the same size. S.C.S.

A82-16153 **Effect of fleet size on estimates of safety against airframe fatigue (Vliv velikosti flotily na odhad unavove spolehlivosti draku letounu).** V. Nejedly. *Zpravodaj VZLU*, no. 3, 1981, p. 111-126. 22 refs. In Czech.

A method is proposed for determining the effect of fleet size on the values of safety coefficients used for aircraft service life estimation. The proposed theoretical solution is based on a statistical analysis of the fatigue damage sequence. Results are presented in a graphical form convenient for practical applications. V.L.

A82-16164 **The application of programmable pocket calculators for computations during survey flights.** H. C. Zorn (International Institute for Aerial Survey and Earth Sciences, Enschede, Netherlands). *ITC Journal*, no. 3, 1981, p. 308-333.

Computation during survey flights can be effectively achieved using a programmable pocket calculator such as the Hewett-Packard C41 model. Using this calculator, formulas and programs have been developed for computing survey turns; wind star; heading and ground speed, given wind vector and required course; pressure altitude required to reach required true altitude; and true airspeed given indicated airspeed, air temperature, and pressure altitude. Other potential applications include the conversion of latitude and longitude to UTM zone and coordinates, and great circle and loxodrome computations. S.C.S.

A82-16172 **Supersonic nozzles without shocks.** M. Burnat (Warszawa, Uniwersytet, Warsaw, Poland). *Archiwum Mechaniki Stosowanej*, vol. 33, no. 1, 1981, p. 117-132. 7 refs.

The Busemann hodograph technique is extended to three-dimensional flows of ideal gases. By using the proposed method of Bernoulli manifolds, it is shown that there exists a wide class of nozzles which transform one uniform supersonic flow into another one without shock. The present analysis can provide a basis for a numerical method aimed at constructing nozzles with specified characteristics. V.L.

A82-16174 **Improvement of the first-ply-failure strength in laminates by using softening strips.** C. T. Sun (Purdue University, West Lafayette, IN) and P. M. Voit. *Composites Technology Review*, vol. 3, Fall 1981, p. 109-113. U.S. Department of Transportation Contract No. RC-92004.

Results of a study of softening strips for various laminates are reported. Baseline systems, all graphite/epoxy laminates, were subjected to stress analysis by means of a finite element program using equivalent elastic constants, with a maximum stress criterion of the first ply failure. Softening strips were added and the tests were repeated. The strip reduced the stress concentration in notched laminated composites and increased the load carrying capability for the first ply failure. It is noted that stresses in individual plies must be calculated to determine the ply failure strength, and also that the width of the softening strip significantly affects the load-carrying capability of laminates. The results are applicable to aircraft structures with fastener holes subject to stress concentrations. M.S.K.

A82-16178 **The Federal Radionavigation Plan.** W. K. May (U.S. Coast Guard, Washington, DC). *(Institute of Navigation, Annual Meeting, Annapolis, MD, June 9-11, 1981.) Navigation*, vol. 28, Fall 1981, p. 231-246.

Policies and plans for the U.S. radionavigation services which are delineated by the Federal Radionavigation Plan are described. Areas of authority and responsibility as well as management structure for defining cost requirements and cost-effective operation are provided, along with various navigation phases and current and future requirements for each phase. Federally operated systems with a high degree of common use, both military and civil, including Loran-A, Loran-B, Omega, VOR, VOR/DME, VORTAC, TACAN, ILS, TRANSIT, MLS, Radiobeacons, and the Navstar GPS are examined for a suitable mix to satisfy user requirements. A preliminary recommendation for the future navigation mix will be issued by the DOD/DOT in 1983, and a decision at the national level will be forthcoming in 1986. It is noted that maritime navigation is tending toward a minimum number of systems, while aviation has witnessed heavy investments in VOR/DME. M.S.K.

A82-16187 **Determination of the flammability characteristics of aerospace hydraulic fluids.** C. E. Snyder, Jr. (USAF, Materials Laboratory, Wright-Patterson AFB, OH), A. A. Krawetz, and T. Tovrog (Phoenix Chemical Laboratory, Inc., Chicago, IL). *(American Society of Lubrication Engineers, Annual Meeting, 35th, Anaheim, CA, May 5-8, 1980.) Lubrication Engineering*, vol. 37, Dec. 1981, p. 705-713; Discussion, p. 713, 714.

The hazards associated with the flammability characteristics of aerospace hydraulic fluids are well known. In an effort to reduce these hazards, commercial airlines converted to the use of a phosphate-ester-based, fire-resistant hydraulic fluid with the advent of jet aircraft in the early 1950s. More recently, some of the military aircraft were converted to a compatible, synthetic-hydrocarbon-based hydraulic fluid for the same reason. The flammability characteristics of these and other aerospace hydraulic fluids and test methods used to determine them are discussed. Since a deficiency exists in the area of determination of the flame and/or fire-propagation characteristics of fluids and lubricants, a new test method was developed and is described. The degree of correlation of the data from this test method with other flammability tests is discussed. (Author)

A82-16267 † **An experimental study of the combustion of liquid hydrocarbon fuel sprayed into a diffusion hydrogen-air jet (Eksperimental'noe issledovanie goreniia zhidkogo uglevodorodnogo topliva raspylennogo v diffuzionnom vodorodno-vozdushnom fakele).** Iu. M. Annushkin and G. F. Maslov. *Fizika Goreniia i Vzryva*, vol. 17, Sept.-Oct. 1981, p. 34-38. 7 refs. In Russian.

Simultaneous combustion of liquid hydrocarbon fuel and gaseous hydrogen has been investigated experimentally using a coaxial jet placed in an air stream along the central axis of a subsonic wind tunnel of 160 mm diameter. It is shown that when the liquid fuel is sprayed into the stream, stable combustion with moderate flame lengths is achieved in a high-velocity air stream even at low hydrogen concentrations. V.L.

A82-16289 † **Mechanism for the elimination of instability in a shimmy problem (Mekhanizm ustraneniia neustoichivosti v zadache o shimmi).** L. G. Lobas and N. V. Nikitina (Akademiia Nauk Ukrainskoi SSR, Institut Mekhaniki, Kiev, Ukrainian SSR). *Matematicheskaia Fizika,* no. 30, 1981, p. 24-28. In Russian.

A theoretical study is presented of a square-law damper suitable for reducing the shimmy of a landing gear strut. Numerical integration shows that the square-law damper leads to the stabilization of self-oscillations, which are then reduced by dry friction. B.J.

A82-16290 † **Self-oscillations of the front caster wheel strut for a given track width under the assumption of the wheel drift hypothesis (Avtokolebaniia orientiruiushcheisia stoiki shassi pri nalichii vynosa kolesa v predpolozhenii gipotezy uvoda).** L. G. Lobas (Akademiia Nauk Ukrainskoi SSR, Institut Mekhaniki, Kiev, Ukrainian SSR). *Matematicheskaia Fizika,* no. 30, 1981, p. 28-34. In Russian.

A theoretical analysis of the self-oscillations of a front caster wheel strut is presented. The dependence of the limit-cycle amplitude on the characteristics of a square-law damper connected in parallel to the elastic element is determined. Numerical results are presented on the occurrence of self-oscillations at velocities above the critical one. B.J.

A82-16335 **FILE-IB aircraft flight test program.** H. M. Thomas (Martin Marietta Aerospace, Denver, CO). In: Guidance and control 1981; Proceedings of the Annual Rocky Mountain Guidance and Control Conference, Keystone, CO, January 31-February 4, 1981. San Diego, CA, Univelt, Inc., 1981, p. 363-378. 5 refs. (AAS 81-041)

The Feature Identification and Location Experiment (FILE-IB) is an earth observation experiment, which was successfully flown on the NASA CV-990 aircraft. The FILE-IB classifies earth scenes into four categories: water, bare land, vegetation, and cloud/snow. The FILE system consists of three major elements: electronics for experiments control, sensors to provide multispectral image data, and a buffer memory and magnetic tape recorder for data storage. The sensors have two silicon-charged coupled device television cameras, one for the 650 nanometer (VR) band, and the other for the 850 nanometer (NIR) band. The data, obtained during eight flight missions over low altitude regions of the U.S. west coast, were analyzed on both a micro and a macro scale: the micro scale analysis, which concentrates on individual scenes, identifies specific classification problems; the macro scale analysis, operating on the statistics for the population of all the scenes, ensures that the algorithm performs well over a variety of scenes. J.F.

A82-16404 # **Direct approach to aerodynamic design problems.** W. C. Chin. *ASME, Transactions, Journal of Applied Mechanics,* vol. 48, Dec. 1981, p. 721-728. 11 refs.

'Direct' small disturbance approaches to inviscid aerodynamic 'inverse' or 'design' problems in two- and three-dimensional subsonic, supersonic, and transonic flow are presented which extend the stream function method of Chin and Rizzetta (1979). The shape solutions generally involve nonlinear differential equations of mixed type for scalar 'streamlike' functions. Dualities relating the analysis problem for camber to the design problem for thickness and the design problem for camber to the analysis problem for thickness are given for planar flow; both closed trailing edges and cusped ones, which are generally opened and which model the displacement effects of viscous wakes, are treated. C.R.

A82-16417 # **Resonant whirling of aircraft propeller-engine systems.** S. H. Crandall and J. Dugundji (MIT, Cambridge, MA). *ASME, Transactions, Journal of Applied Mechanics,* vol. 48, Dec. 1981, p. 929-935. 5 refs.

At a critical speed, a light aircraft can experience severe vibrations in steady flight in which the propeller blades vibrate at one frequency while the engine block vibrates at a lower frequency. A model is presented which explains this phenomenon. A three-bladed propeller-engine system is considered to have six rigid-body degrees of freedom plus six blade vibration degrees of freedom. This system is analyzed and simplified by introducing a constraint based on observation of the flight phenomenon. Multiblade coordinates are introduced and a linear eigenvalue problem is derived which describes whirling motions of the engine coupled to progressive waves of blade deformation which circle the propeller disk. These whirling motions are excited by harmonics of the transverse forces on the engine due to the explosive gas pressures in the cylinders. The effects of varying the propeller blade pitch angle are studied and a high-speed instability mechanism is examined. (Author)

A82-16428 # **Cavitation inception in spool valves.** C. S. Martin (Georgia Institute of Technology, Atlanta, GA), H. Medlarz (Karlsruhe, Universität, Karlsruhe, West Germany), D. C. Wiggert (Michigan State University, East Lansing, MI), and C. Brennen (California Institute of Technology, Pasadena, CA). *ASME, Transactions, Journal of Fluids Engineering,* vol. 103, Dec. 1981, p. 564-575; Discussion, p. 575, 576. 40 refs. Cavitation has been investigated in directional control valves in order to identify damage mechanisms characteristic of components of aircraft hydraulic systems. Tests have been conducted in a representative metal spool valve and in a model three times larger. Data taken under noncavitating conditions with both valves showed that the position of the high-velocity annular jet shifts orientation, depending upon valve opening and Reynolds number. By means of high-frequency response pressure transducers strategically placed in the valve chamber cavitation could be sensed by the correlation of noise with a cavitation index. The onset of cavitation can be detected by comparing energy spectra for a fixed valve opening and a constant discharge. Another sensitive indicator of cavitation inception is the ratio of cavitating to noncavitating spectral densities. The incipient cavitation number as defined in this investigation is correlated with the Reynolds number for both valves. (Author)

The use of the Waverider concept for an atmospheric entry vehicle is discussed. The Waverider has a flat upper surface, a straight leading edge, and anhedral 'V' shaped wings. Entering an atmosphere at near-orbital speed, the craft would fly with nose-up at a high angle of incidence, riding a plasma shock wave, heating to an equilibrium temperature of 1500 C, and offer the opportunity for a low-speed landing at a wider choice of sites than the Shuttle. The flat upper surface protects against radio black-out and can be used as a platform for planetary exploration instruments. Martian aerographic, and Venus and Jupiter missions are examined, noting that the Waverider would probably never land on Venus and Jupiter due to its aerodynamic characteristics and the densities and wind speeds of the two planets' atmospheres. The use of mass-driver launched Waveriders to deliver raw materials directly from the moon to earth is also explored. D.H.K.
